# ADMINISTRATION REPORT OF IRRIGATION WORKS IN THE BOMBAY PRESIDENCY FOR 1926-27. 

## I.-General. <br> A.-Details of Direct Expenditure.

1. In the year 1926-27 the direct expenditure (excluding collection charges) on all Irrigation Works throughout the Presidency amounted to Rs. $302 \frac{1}{2}$ lakhs compared with Rs. $331 \frac{3}{4}$ lakhs in the previous year, and Rs. $247 \frac{1}{4}$ lakhs, the average.* The total is classified and divided between the Presidency proper and Sind as follows:-

2. The distribution of the above expenditure under several Irrigation heads is given below :-

[^0]
## B.-Figures for Works for which Capital Accounts are kept.

3. The receipts on Capital Irrigation Works compared with the year's working expenses show a profit of Rs. 33,16,592 and Rs. 15,09,803 in Sind, and Deccan and Gujarat, respectively. If, however, interest chrges on works in operation are taken into account the result shows a profit of Rs. 17,82,511 for Sindand a loss of Rs. $6,87,863$ for the Deccan and Gujarat.

4. The area irrigated under works for which capital accounts are kept was $3,696,500$ acres which shows an increase of 14,600 acres as compared with the average. In Sind there was an increase of 24,600 acres while in the Deccan and Gujarat there was a decrease of 10,000 acres.

## C.-Figures for Works for which no Capital Accounts are kept.

5. These are works for which neither Capital nor Revenue accounts are kept or miscellaneous works. The receipts on these works are principally in the form of a share of the land revenue and are termed "Indirect" and as such are book credits, so that figures of revenue appearing in the Finance Accounts, as distinguished from the statistical statements accompanying the Irrigation Administration Report, are very small, being for direct revenue only, viz., proceeds from sale of water, etc. The following statements give a comparsion of the figures for this year and the average :-

## D.-Review of Irrigation.

## Description of Irrigation.

6. The Irrigation works are divided into two distinct spheres, viz. (1) Sind and (2) Deccan and Gujarat. In Sind the rainfall is usually negligible and the canals depend upon the river Indus, fed from its own upper reaches and by its tributaries for their supplies. The great majority of the canals are inundation canals, i.e., they flow only when the river is high, the water level in the Canal depending on the natural river level, and for the remainder of the year are dry. On an average the period of flow of these canals may be taken as from the 15th June to 30th September. For the rest of the year cultivation is restricted to areas served by wells, or to lands which have been flooded during the inundation season. When the Lloyd Barrage Scheme, which is under construction, comes into operation, perennial irrigation will displace the present precarious inundation supply throughout that large area of Sind commanded by this Scheme. It will then be possible throughout the year to raise the river level at the heads of the new canals to the necessary height thereby ensuring to the fields a constant and fixed supply of water in lieu of the present uncertain one.
7. In the Deccan and Gujarat rainfall is available for agricultural operations but it is often precarious. Tanks and canals provide irrigation to valuable crops like sugarcane and they are a source of supply to other crops also when the rainfall is deficient or irregular. The large irrigation systems in the Deccan are all of the same type. Each depends upon a storage lake near the head of one of the river valleys, where sufficient water is collected during the monsoon to supply, throughout the rainless period of the year, the country on either side of the river-valley below.

## Inundation and Rainfall in Sind.

8. The inundation of 1926 was on the whole a good one. The rainfall during the season was well above the average and was generally well distributed and beneficial to the crops.

## Irrigation and Rainfall in the Deccan and Gujarat.

9. In the Deccan the year on the whole was a favourable one. The monsoon opened well and there was timely rainfall throughout the season. In Cujarat the year was marked by plentiful and well distributed rainfall.

## Area irrigated and gross revenue.

10. The area irrigated in Sind during the year was about 3.5 million acres as against $3 \cdot 3$ million acres in the previous year and the gross revenue amounted to Rs. $89 \cdot 5$ lakhs as against Rs. $82 \cdot 9$ lakhs for 1925-26.
11. The total area irrigated in the Deccan and Gujarat was 429,800 acres as against 454,300 acres in the previous year and the gross revenue amounted to Rs. $35 \cdot 5$ lakhs as against Rs. $34 \cdot 5$ lakhs for 1925-26.

## II.--Sind.

## I. Nature of Inundation and Rainfall. Inundation.

12. The inundation of 1926 was on the whole a good one. The fair irrigating level of 13 feet on the Bukkur Gauge was first reached on 3rd August or 27 days later than in 1925. This level of 13 feet and above was maintained for 44 days as compared with 32 days in 1925, 50 days in 1924, 16 days in 1923 and 33 days, the average. The fair irrigating level of 17 feet on the Kotri Gauge was first reached on 21st July, i.e., 24 days later than in 1925 and this level and above was maintained for a period of 68 days as compared with 76 days in 1925, 86 days in 1924, 76 days in 1923, and 79 days, the average. The highest recorded levels during the year were $15 \cdot 3$ and 22.7 feet on 21 st August and 5th September on the Bukkur and Kotri Gauges respectively as compared with $15 \cdot 7$ and $22 \cdot 1$ feet in 1925 and against the maxima of 17.9 feet and 23.8 feet respectively on these two gauges.

## Rain fall.

13. The rainfall during the season was well above the average and was generally well distributed and beneficial to the crops.

## 2. Indus Right Bank Circle. <br> (i) Works for which Capital Accounts are kept.

## Desert Canal.

14. The canal was opened on the 30 th May 1926 with a gauge reading of 4.4 feet at Head Regulator. It ceased to flow on the 6th November 1926. Full supply level of $9 \cdot 0$ or over was maintained in the canal for 44 days against 29 of last year. The set of the river feeding the dhand from which the Desert canal takes its supply was very favourable throughout the Abkalani. The cultivation on this canal system was on the whole good.
15. The Adiowah did not flow long as it was opened on 18th July and stopped flowing on 23rd September 1926 with Bukkur reading 8.6 as the river at the head of Shahwali dhand had receded. It is therefore proposed to have a new cut to the Adiowah from the Desert main dhand. Owing to deficiency of water supply, some karias ex-Desert canal between the head regulator and Drakhan regulator were opened. The highest gauge reading was $5 \% 6$ feet on 19th August 1926.

## Unharwah.

16. The Unharwah was opened on 30th May with a gauge reading of $5 \cdot 2$ feet at the Tori stop gate. It ceased to flow on 11 th November. The highest gauge reading below Tori stop gate regulator was 10.2 feet against 10.3 feet last year. Owing to deficiency in the canal during June and July, rotations were resorted to. The cultivation on the whole was good.

## Begari Canal.

17. The Begari canal was opened on the 3rd June 1926 with a gauge reading of 0.3 feet above the Bunda. It ceased flowing on 3rd December 1926. In the beginning of the Abkalani, supply in the Begari had to be supplemented by giving a new cut from the river through some borrow pits. This supplementary cut brought a very good supply in July. Full supply level, viz., 12.0 feet and over was maintained for 64 days against 24 days in 1925. The Rabi head was opened on 28th September 1926. The canal had a maximum discharge of 8,737 cusecs against the designed discharge of 6,900 cusecs. The cultivation on the whole was good. The rains in August helped the standing crops to a very great extent.
18. The Choi branch worked well, there being a good supply in the canal itself as well as in its distributaries. It ceased to flow on 10th October 1926.

## Mahiwah.

19. The Mahiwah was opened on 6th June 1926 with a gauge reading of 7.4 feet. It flowed for 117 days against 115 days in the previous year. The Mahiwah system worked very well throughout the season. No great necessity for Kharif rotations was felt, but rabi rotations were allowed from the middle of September until the canals ceased to flow.

## Sehar Canal.

20. The Sehar canal was opened on 6th June 1926 with a gauge reading of 5.9 feet and worked well throughout the season. It finally ceased to flow on the 30th September 1926. To improve the supply in the Seharwah, proposals for cutting off bad bends, widening the canal and constructing a cross regulator are under consideration.
21. The dhand feeding the Masuwah was cleared so as to give a better supply to the latter. It flowed well throughout the season, but on account of adverse set of the river, its mouth silted up in September and the canal ceased to flow on 23rd September. The kharif crop did not, however, suffer and rabi rotations were given by supplying water from the Mahiwah.
22. The Maharowah takes off from the Masu dhand. A cut to feed this canal had been excavated last year through the Masuwah which greatly improved its condition. The canal was cleared last year so as to correspond with six feet at Bukkur gauge and a " Bunda " was put at the junction of the old Maharowah and the new diversion, both of which helped to give better flow to the tail of the canal. The canal as a whole worked satisfactorily. It was opened on 18th June with a gauge reading of 3 feet and stopped flowing on 24th September. It flowed for 98 days against 62 days in the previous year.

## Sind Canal.

23. The Sind canal was opened on 2nd June 1926 with a gauge reading of 5.5 feet. In the beginning of the season it was feared that owing to active river erosion about a mile above the canal, the upstream mouth of
the dhoro feeding the canal would be silted up, but on the contrary the bed of the dhoro scoured in August and September and became a large bye-river. There was active erosion at the head of the new feeder which supplies water to Mirzawah which carried away the old head regulator over this new feeder.

## Rajib, Chitti and Garang Canals.

24. The Garang and Chitti canals take off from the Sukkur canal feeder and the Rajib direct from the Indus. The Garang began to flow on 18th July with a gauge reading of 2.0 feet and ceased to flow on 18th September. The Rajib flowed on 2nd June with a gauge reading of $3 \cdot 3$ feet and ceased to flow on 30th September. The Chitti flowed on 3rd June and stopped flowing on 25th September. Owing to late rise of water, comparatively very little rice cultivation was done. It is expected that dry kharif and rabi willon the whole be good except in the case of Garang where the crops are expected to be fair. The question of widening and extending these canals is under consideration.

## Garkino Canal.

25. The Garkino canal was opened on 15th July 1926 with a gauge reading of 1.8 feet. The canal worked satisfactorily. With rotations on the rabi regulator a vast area was flooded for rabi. The canal ceased to flow on 2nd October. No flood water entered the canal this year.

## Ghar Canal.

26. A new feeder was excavated during the year to the Ghar dhand one mile below the head of the bye-river, but owing to low river during the whole of June, the feeder did not give sufficient supply. In the first week of July the main current of the river being close to the head of the feeder, erosion took place causing-silting of the channel and consequently falling off in discharge. To stop further silting, scrapers and boats were utilised from 29th July up to 30th August with fairly successful results. The Arab dhoro which takes off from the river about 9 miles above the Ghar has been cleared and widened this year to act as a main feeder to the Canal instead of the feeder excavated in 1925-26 and is so far working satisfactorily. On account of the river being low and the mouth of the bye-river at the head of the Ghar dand being unfavourable, the canal which was opened on 1st June ceased flowing on 6th June. It again flowed from 20th June but the water supply in the canal was inadequate until the middle of July. It finally ceased to flow on 3rd October. The gauge at the head recorded full supply level of 11 feet for 22 days against nine days during the last year.
27. The Fordwah was opened on 8th June when Bukkur read 6.2 feet. It worked satisfactorily throughout the whole abkalani, the river at the mouth of the canal being most favourable. The canal was regulated from second week of August to end of third week of September owing to the Char canal running at and above full supply level. It ceased flowing on 26th September,
28. The Naurang and Nurwah, the two main branches into which the Char canal bifurcates worked well. The two main branches of the Naurang Canal, viz., the Guth and Chilo also worked satisfactorily.
29. The Kur Dato is another large branch, $26 \frac{1}{2}$ miles long taking off at mile $37 / 4$ of the Char canal. It was opened on 9th June. On the whole the supply was fairly satisfactory.
30. The Nasrat Kado first flowed on 22nd June. As this canal depends directly on the new feeder to the Char dhand its fate was the same as that of the Char itself in the upper reach. To help the rabi lands above the 9 th mile regulator of this canal, special rotations were given twice in the month of September. The gauge at head recorded the full supply level of 10 feet and over for 12 days against 5 days during the last year.

## Sukkur Canal.

31. The Sukkur canal has two heads, one for'kharif called the Rahuja Head and the other for rabi called the old head. The former gets its supply from the bye-river which takes off the river about 15 miles above Sukkur, while the latter takes off direct from the river just above the Lansdowne Bridge at Sukkur. There was no trouble of silt in the bye river. The low level of water in it was chiefly due to the unfavourable set of the river and to the silting of dhoros, which usually discharge in the channel. The bye-river has been widened and deepened this year togive the required discharge. The supply in the canal was deficient in the beginning when the river was low but it improved to some extent with the rise in the river. The full supply level of 17 feet at the Shikarpur road bridge was recorded for only four days against 22 days in the previous year. To help the standing crops to mature, when the river fell early in September, the rabi head of the canal was opened on 20th September to supplement the supply. Rotations were resorted to at the Changhra regulator for the benefit of the kharif crops.

## Western Nara.

32. The Western Nara was opened on 1st June with a gauge reading of 6.7 feet on the head regulator. It reached its designed full supply level on the 6th August and remained at and above that level for 43 days up to 17th September when the river fell off gradually. Owing to the late rise of the river, rotations were given to save the seedlings and to help cultivation in the Mehar and Kakar talukas. The abkalani on the whole was very good excepting in the Mehar sub-division where the supply had to be increased by rotation of karias. There was, however, good rabi cultivation. Erosion in the river continued to threaten the head regulator and therefore another regulator was constructed at mile $3 / 2$ of the Western Nara, i.e., about nine miles below the present head. The "bunda" constructed at Chario Wahur to restrict supply flowing to the Manchar and thereby preventing the kharif cultivation in the tail of the Nara from getting submerged proved beneficial. The silt clearance experiment in the Kakolwah was repeated but the result was not satisfactory as the tail reach did not derive any benefit therefrom.

Head Regulator, Baghar Canal.
6 Spans of 25 Ft . each. R. L. of Pavement 17.6.
Downstream View.

## Pritchard Canal.

33. The Pritchard canal was opened on 3rd June. In the beginning of the abkalani there was some danger of river erosion at its head, but during the inundation season the current of the river diverted to the left bank leaving a very good deep dhand which worked very satisfactorily. The masonry gap continues to produce excellent results. The full supply level of 10 feet and over was obtained for 40 days.

## Pinyari Canal.

34. The Pinyari Canal commenced flowing on 23rd May with Kotri reading 11.9 feet. In June the river was low. A rotation was therefore allowed at Daro regulator. The river rose favourably after July. The general condition of the crops was excellent. The improvements already carried out to the canal by means of removing bends from the river to Daro and groyning at wide places have done much good. A project for remodelling the whole system is under consideration.

## Baghar Canal.

35. The Baghar canal commenced flowing on 15th May and ceased to flow on 12th December. Owing to very heavy rain on 2nd September the Abad Baphi burst at mile $1 / 0$; the breach could not be closed and water began to top the Baphis almost everywhere resulting in uncontroll.able breaches in Baphis Halla Manda and Dhumani West. The breach water was, however, carefully diverted to waste land via Makli Hills and thus the damage to crops was minimized. The kharif crop on the whole was very good where it was not ruined by the flood water, and there was good rabi in the flooded tracts. Hitherto the head of the Baghar was uncontrollable and the banks being weak there was no safety at all. With the head regulator, which has now been completed and the bunds that are being constructed on both sides of the canal, the Baghar tract will be secure from floods and will improve. A project for further remodelling of this system is under consideration.

## Kalri Canal.

36. The Kalri canal commenced to flow on 1st June with Kotri Gauge reading 13.6 feet. The canal on the whole worked satisfactorily, flowing for 122 days. All canals under this system worked well with the exception of two or three small branches where the tail supply in the beginning was deficient owing to silt trouble, which has been remedied. The kharif crops were good where they were not flooded by breaches in the Baghar Baphi and there were good rabi crops in the flooded area. A project for remodelling the system is under consideration.

## Sattah Canal.

37. The Sattah canal began flowing on 31 st May when Kotri read $13 \cdot 6$ feet. It obtained full supply level on 21 st August and finally stopped flowing on 17th of October. Deficiency was experienced at the tail and on the Rajwah branch. A project for remodelling the system is under contemplation. Rotations were resorted to at the beginning of the abkalani
to save seedlings at the tail and on the Rajwah. Cultivation on the system was generally good.

## (ii) Works for which Capital Accounts are not kept.

38. The following are the principal works which were completed or were in progress during the year under report :-

## Karachi Canals Division.

## 3. Indus Left Bank Circle.

(i) Works for which Capital Accounts are Kept.
39. The canals in the Indus Left Bank Circle fall under two groups, viz. : (a) the Eastern Nara System (b) Canals taking off direct from the Indus.
Under (a) are the Nara river and the Jamrao, Mithrao, Khipro, Thar and Hiral Canals, all of which except the Khipro Canal, which flows during the inundation only, are semiperennial. The Thar and Hiral Canals are, however, closed on 1st December every year to save the land under their command from being water-logged.
Under (b) are the Dad, the Nasrat, the Fuleli, the Hassanali and a large number of small canals which are classed as inundation canals. The Fuleli receives a very fair rabi supply.

> (a) The Eastern Nara System.
> Nara Supfly Channel.
40. The Nara Supply channel is an artificial cut 12 miles in length taking off the river on its left bank above Rohri and joining the Nara, an ancient course of the Indus. Its discharging capacity is about 20,000 cusecs dưring high inundation, The Nara river below the supply channel
has no regular banks and as soon as the discharge in it exceeds 5,000 cusecs the water begins to overtop the banks and touches the Flood Diversion Bund on the east and hills on the west.
41. On the whole the Eastern Nara Supply channel worked very satisfactorily during the season and showed a marked improvement over the previous season. The exclusion of flood-water by maintaining the Flood Diversion Bund intact, the successful working of cuts Nos. 2 and 3 of the Nara and the work of the dredger in deepening the channel have contributed greatly to the better working of the channel. There were the usual heavy silt deposits below the 10th mile and the dredger was usefully employed in removing these and maintaining a good working channel.
42. The maximum discharge was 17,779 cusecs with a gauge reading of 23.0 feet upstream and 22.4 feet downstream on 28 th August 1926 as against 20,493 cusecs observed last year on 8th August 1925 with a gauge reading of 23.5 feet upstream and 22.8 feet downstream.
43. The minimum discharge was 215 cusecs with a gauge reading of 5.5 feet upstream and downstream on 23 rd March 1927 against 14 cusecs on 10th March 1926 with a gauge reading of $5 \cdot 3$ feet upstream and downstream.

## The Nara.

44. The length of the Nara from the end of the Nara Supply channel to the Jamrao Head Works is about 96 miles and from the Jamrao to the Thar weir 107 miles. It commands over 500,000 acres of culturable land. The area cultivated during the year on the Nara was about 52,118 acres against 43,931 acres of the last year and 45,405 acres, the average.
45. The inner bunds which give trouble when the downstream gauge at Makhi exceeds 14 feet have been further strengthened this year and it is expected that more water can now be passed with safety. The Makhi dhand is situated above the Mithrao head. It is fed from the Nara canal through the Moorhal and Baghdad sang sluices. These sluices are opened if necessary when Jamrao is closed for scouring its approach channels and to reduce pressure on the new bunds between Jamrao and Makhi weir. But in spite of this and the good rainfall this year, the level in the dhand did not rise high enough and dried up early in November.

## Jamrao Canal.

46. The Jamrao Canal was closed on the 30th August and the undersluices fully opened for the purpose of scouring the approach channel for 8 days. The operation of scouring the silt was done successfully. Apart from this occasion the undersluices were kept closed and all regulation was done at the weir regulator. The maximum discharge measured in the Nara above the weir was 10,816 cusecs on 17th September 1926 and the minimum was 287 cusecs on the 15th February 1927.
47. The area cultivated during the year was about 216,975 acres against 198,847 acres of last year and 214,344 acres, the average. The area under cotton during the year was about 115,270 acres
against 118,897 acres of last year and 118,035 acres, the average. The rainfall was above the average and beneficial to kharif crops. There was practically no rain during the rabi season. The total area cultivated under Adhawa crop was 1,284 acres against 1,030 acres cultivated last year. The increase is due to better supply during the season under report. The kharif area sown was 186,043 acres against 184,042 acres cultivated last year. The area sown under rabi was 30,640 acres against 14,805 acres of last year. The increase is due to better water supply in the beginning of the season although the outturn was less than normal as the supply was not sufficient at the end of the season.

## Mithrao Canal.

48. This is a semi-perennial canal taking off the Nara above Makhi regulator. The canal worked with rotations almost throughout the season except during the rainy period and when the river was at its height during August and September. This is a direct result of the satisfactory working of the moduled distributaries and making better distribution possible. Several direct outlets were stopped this year, though some of them were again allowed as a temporary measure owing to deficiency in the Makhi Right and a low supply at the tail of the Kandiari minor. A silt trap at the head of Makhi Right was made to eliminate the silt entering the canal, and the Kandiari Minor has been regraded and a raised level supplied at the tail.
49. The Makhi Left distributary and Chotiari minor worked satisfactorily. The Makhi Right distributary worked as an inundation canal as usual without rotations. It began to flow late owing to late rise of water in the river. It got its full supply from 19th July to 2nd October.
50. The 9 th mile right and left Bank branches worked satisfactorily. The 9th mile left branch has been regraded and its tail portion which hitherto had to be fed by a direct mouth from the Mithrao got its supply quite satisfactorily from the distributary itself. The question of prom viding modules in place of existing submerged sluices is under consideration. The Santor Minor which takes off from the 9th mile left bank branch worked satisfactorily. The Kandiari minor which takes off from the 9 th mile Right bank branch worked well but as the hydraulic gradient was steep the water level at the tail did not compare favourably with that in the Mithrao. Regrading of this minor has since been carried out.
51. The 30th mile left bank distributary worked well and had continuous supply without rotations for 2 months.
The 30th mile right bank distributary is practically a lift canal and worked fairly satisfactorily.
52. The 45th mile left bank distributary worked very well right upto the tail. All the karias on this distributary have been provided with modules.
53. The area cultivated on the Mithrao was 109,986 acres as compared with 100,503 acres last year and 103,627 acres, the average.

## Khipro Canal.

54. The Khipro canal takes off from the right bank of the Nara. It is purely an inundation canal. It was opened on 1st June with a gauge reading of 0.9 feet at head. The highest gauge reading this year at its head was 4.8 feet. Internal rotations were carried out as usual but water went only up to the 13 th mile. Necessary clearance was done.
55. The cultivation during the year on this canal was 5,709 acres against 4,477 acres of the last year and 4,476 acres, the average.

## Thar Canal.

56. The Thar canal was opened on 8th May but owing to deficient water supply due to late rise of the river water was given in rotation of 2 sets of 3 days each with 2 days closure for collection at Thar weir upto the beginning of August. The water supply having increased subsequently the period of rotation was increased to 4 days and the collection period reduced to one day. As there was good rain and more water became available the collection was altogether stopped from 17th August to 28th September. All the branches and distributaries got their proportionate share of water by these rotations. Karias on 3rd and 7th mile distributaries were reduced so as to give designed discharge.
57. The cultivation during the year was about 42,684 acres against 36,282 acres of the last year and 41,820 acres, the average.

## Hiral Canal.

58. The Hiral canal was opened on 8th May. Rotations similar to those described for the Thar canal were given.

The cultivation during the year was about 13,330 acres against 11,506 acres of the last year and 12,007 acres, the average.

> (b) Canals taking off direct from the Indus.
> Nasrat Canal.
59. A new cut from the river was given to the Lundi feeder, 2 miles in length and joining the old cut at Taki 46. The new cut with very favourable conditions at its head promised to be a turning point in the life of the Nasrat and actually did fulfil all expectations by bringing a very satisfactory supply into the canal which continued flowing without any break until Bukkur went below $2 \cdot 0$ feet.
60. The Nasrat canal was opened on 23 rd May and ceased to flow on 7th November. Judicious rotations were carried out in the months of June and July to save the standing crops.
61. The cultivation during the year was about 112,428 acres against 85,889 acres in the last year and 87,175 acres, the average.
62. An allotment of new land to the extent of about 362 acres was made during the year.

## Naulakhi Canal.

63. The Naulakhi canal was opened on 25th May and ceased flowing on 19 th October. It worked fairly well on the whole and received full
supply level for 40 days and 36 days at Darbello and Tharushah bridges respectively.
64. The area cultivated during the year was about 37,103 acres against 54,117 acres in the last year and 52,581 acres, the average.

## Dambhro Canal.

65. The Dambhro canal was opened on 28th May and with all its branches practically gave no trouble. It worked satisfactorily on the whole and stopped flowing on 30th September. It received full supply level for 54 days.
66. The area cultivated during the year was about 9,923 acres against 14,664 acres in the last year.

## Dad Canal.

67. The Dad canal was opened on 25th May and ceased flowing on 13th November. Owing to a low river in the beginning of the season rotations were carried out in June and July but during the months of August and September, the supply was excellent without rotations. It maintained full supply level for 65 days at its head.
68. The cultivation during the year was about 108,475 acres against 115,022 acres in the last year and 130,698 acres, the average.
69. The construction of regulator at mile 65 of the Dad was started and a sum of Rs. 6,624 spent during the year.
70. An allotment of new land to the extent of about 20 acres was made during the year.
71. The Ren distributary takes off from the Dadwah at mile $47 / 4$ right bank and irrigates most of the tract formerly watered by the Renwah and other canals. The distributary can get full supply level by closing the cross regulator at 50 th mile of the Dadwah and has the advantage of rotations when the supply in it is insufficient and the water level low. The total length of the distributary including its minors is 38.4 miles. It is provided with three regulators. The distributary started to flow on 5th June and ceased to flow on 13th October and on the whole the supply in it was satisfactory and the crops irrigated were fully matured.
72. The cultivation during the year was about 9,152 acres against 8,550 acres in the last year.

## Fuleli Canal.

73. The new Fuleli Canal takes off from the river near Jamshora village, $5 \frac{3}{4}$ miles from Hyderabad. It is an old tributary of the Indus and is 81 miles in length. There are many sharp bends hence erosion of banks at high water. Such portions have as far as possible been provided with stone or wooden groynes to prevent scour. The head is very favourable and can flow with 2 feet at Kotri and gets a perennial supply. The maximum and average discharges were 10,858 cusecs and 6,332 cusecs respectively.
74. The head regulator with the new regulating apparatus was very much easier to work and water could be reduced quickly. Deficiency
was felt in the first two months of the abkalani and rotations were carried out at Alipur. The earthwork in connection with the raising of the banks of the canal from head to mile $81 / 2$ was completed and the work of remodelling the Mithnawah and Shadiwah distributaries was in progress. The survey for remodelling the branches of the Fuleli was also in progress.
75. The area irrigated during the year was about 420,000 acres against 445,924 acres in the last year and 430,629 acres, the average.
76. The old Fuleli has no head regulator but has a cross regulator in the 9 th mile at Nareja. In the beginning of the season the Nareja regulator was tightly closed so as to head up water for the requirements of the branch canals above it.
77. The maximum and average discharges were 2,694 and 1,921 cusecs respectively.

## Hasanali Canal.

78. The Hasanali canal takes off from the Indus between Khairwah and Nurwah near Katiar. It worked very well even during the low level period. Water was given to high lands by closing cross regulators. This year groynes were constructed in the head reach and banks constructed to prevent the head of the canal being overtopped by river spill.
79. The area cultivated during the year was about 20,491 acres against 18,984 acres cultivated in the last year and 19,281 acres, the average.

## Other Canals in the Fuleli Canals Division.

80. The canals in the Hyderabad Sub-division worked fairly well. Chandanwah and branches could not get water earlier than 6th July and therefore had to be given water from the old Fuleli by opening an old head of the Kangan Khadi in order to start cultivation operations. When the river rose it had more than sufficient water.
The canals in Katiar sub-division worked well inspite of the fall in the river towards the end of the season.

## Canals in the Hyderabad Canals Division.

81. The following canal systems come under this Division :-
(1) The Alibahar Kacheri.
(2) The Great Marakh.
(3) The Nasir.
(4) The Sarfraz.
(5) The Gharo Mahmudo.
(6) The Kari Shumali.

With the exception of Chaluwah, Great Marakh, and Gharo Rano, all the canals were seriously and adversely affected by the low river in the early part of the season. Wherever possible, various methods such as gupcher clearance of the head, etc., were resorted to in order to supplement the water supply to the canals. Fortunately the river rose steadily after the 15th July and maintained a good level until the end of the inundation.

This enabled the late season crops to reach maturity. Excellent and timely rainfall also helped the cultivation to a considerable extent.
82. The cultivation in the whole Hyderabad Canals Division (except the Ren distributary) was about 256,134 acres against 271,432 acres in the last year and 273,031 acres, the average.

## (ii) Works for which Capital Accounts are not kept.

83. The Mehrab and other canals in the Nasrat Canals Division worked well during the year but the Renwah and other canals in the Hyderabad Canals Division suffered from deficiency of water supply.

## 4. Protective Embankments.

## Kashmor Bund.

84. The flood touched the Haibat loop, 1896 loop and new Tori Cross on 2nd, 22nd and 28th June respectively and the Gouspur and Tori loops on 15 th and 22nd July. All the leaks that occurred were promptly closed. The maximum flood levels at some of the important places along the bunds, viz., Gouspur loop at 0 mile, Tori bund mile $7 / 3$ and new Tori Cross were $11 \cdot 10,11 \cdot 50$ and $10 \cdot 30$ feet respectively. There was heavy wave-wash along the Gouspur loop in the first six miles and new Tori Cross bund which were protected by Tooas and mats to counteract the action of the waves. There was active erosion from mile $3 / 6$ of 1896 loop towards the Begari head. More than $3 / 4$ th of a mile opposite the Begari old head was eroded away during this abkalani. Several portions of the bund were wetted with satisfactory result by means of pumps.

## Bunds in the Shikarpur Canals Division.

85. The level of water against the Adartakio loop was 4 feet higher than the highest level on record, and that against the 1910 loop was one foot above the previous highest level. The set of the river below Chak being on the left bank, water touched the bund only at low places. The Surfu; Arain and 1913 loops and four miles of Adartakio loop were very well soaked, while the Beechanji and Garang loops were not properly soaked owing to the set of the river being on the opposite side. There were a number of leaks in the 1910 Arain loop trenching bund and Beechanji loops, all of which were promptly closed. Two sluices in the Sukkur Begari Bund cracked very badly and became very dangerous, but mangulis were constructed in front and the sluices entirely closed. Water touched Satabani loop on 1st August and by 14th August it had risen to $7 \cdot 3$ feet. When the river was rising rapidly cuts were given to Loi loop and to both the barks of the new Feeder and of the Sind Canal which gave a good flow in advance of the rise. During the night of 12 th August there was a heavy storm, causing erosion in a length of about 600 feet, the river coming to within about 400 feet of the front bund. Cuts were therefore given in the left bank of Colonel Fife's Channel and in the 1913 loop to let water in and against the Arain loop. Cuts were also given for the same purpose in the Loi loop and in both the banks of the new Feeder and of the Sind Canal. Two mangulis were constructed ing front of sluices in miles $24 / 1$
and $24 / 5$ of the Sukkur Begari bund. A leak in the Arain loop which enlarged rapidly into a tunnel-like opening through the bund was closed before a breach occurred.

## Ghar Bunds.

86. This year the river water touched the Saidabad Jhali bund from miles $8 / 4$ to 11 , and from miles 13 to $23 / 6$. On 20th August a breach occurred in mile $19 / 2$ and was closed on 8th September. River spill touched the Mitho Phulu bund at miles 37/7 to 50/2. One bad leak which was promptly closed occurred at mile $43 / 1$ from spill water. There was slight erosion opposite miles $39 / 2$ to $40 / 0$ of the Mitho Phulu bund.

## Western Nara Bunds.

87. The Abad loop was sand-trenched where the soil was bad. The flood level between miles 41 to 45 was abnormal and the bund not having been previously soaked gave a good deal of trouble. There were numerous leaks which were detected in time and closed. There were some leaks in miles $92 / 3$ and $92 / 4$. Sand coring was provided in places where considered necessdry.

## Flood Diversion Bund.

88. Water touched the entire length of the bund. There was a very bad leak at mile $9 / 0$ which threatened to develop into a breach but by strenuous efforts it was eventually closed. There were a few small leaks which were closed in time to prevent breaches.

## Bunds in the Karachi Canals Division.

89. When the river was at its highest, owing to very heavy rain, almost all the bunds were in danger of being washed away. The bund line on the whole with the exception of the Baghar Uchito bund, however, withstood the strain and the minor leaks which occurred were immediately closed. The breaches in the Baghar Uchito bund, caused much damage and destroyed a good deal of the standing cultivation in Ghorabari and Tatta talukas. Two breaches also occurred in the Kokawari main bund in front of the new loop but they did practically no harm as the flood water was effectively held up by the new Retired loop which had been wetted during the abkalani. A new retired loop (Abad Marho loop) is being constructed this year owing to active erosion of the river opposite it.

## Bunds in the Nasrat Canals Division.

90. All bunds in the Nasrat Canals Division were maintained in good condition and there were practically no leaks or breaches. The work of constructing the new left bank river embankment 23 miles long was in progress.

## Bunds in the Hyderabad Canals Division.

91. The Saidichar and Ren bunds are the only bund lines in the Hyderabad Canals Division. The Ren bund which is intended to prevent the country served by the Ren distributary ex Dad from being flooded is 3 miles and 3 furlongs in length. The Saidichar bund is 3 furlongs and F ${ }^{-1-c}$

420 feet in length and is intended to prevent the country round about Sakrand from being flooded by the escape water from the Dad canal. No leaks or breaches occurred in these bunds.

## River bunds in the Fuleli Canals Division.

92. The river spills spread against the whole of the Challian bund, Jamshora front bund, Gidu Malh bund and Hajipur bund. Due to high winds, all these bunds were subjected to wave-wash in exposed portions and were protected by juckwork. Day and night patrol was organized as usual and continued till the river fell to a safe level.
93. The Hajipur Bund has two loops, one at first mile and the second at 11th mile. At both of these places the river is very near to the front bund and the loops have been raised and strengthened this year. As the rear of the Hajipur bund, mile 14/0 to 14/7, was subject to very heavy wavewash owing to the 11 th mile loop compartment being filled to a higher level than usual the rear slope has now been protected by a new Muhari.

## 5. Indus River Commission.

## Indus River Commission Works and their classification.

94. The expenditure on all the works including surveys carried out under the direct supervision of the Chief Engineer in Sind during the year under report was charged to " 15-Other Revenue expenditure financed from ordinary Revenues-Works for which neither Capital nor Revenue Accounts are kept."

## Survey of the Indus.

95. The Indus was surveyed from 34 miles above Kashmor to the bifurcation at the delta and portions of the two branches below the point of bifurcation, viz., the first $18 \frac{1}{2}$ miles of the Hyderi and $6 \frac{1}{2}$ miles of the Uchito were surveyed and plotted. The total length of the traverse survey done during the year was 1,005 miles against 1,082 miles last year.

## Demarcation of District and State boundaries.

96. The work of maintaining the Bhawalpur, Khairpur and District Boundaries by keeping the base lines clear of jungle was done during the year. A part of the demarcation of a rectified boundary between the Hyderabad and Karachi Districts was carried out. The re-demarcation of the boundary between dehs Chach and Karampur in Taluka Sehwan and deh Sukhpur in Takula Sakrand in the Larkana and Nawabshah Districts respectively was also carried out.

## Gauge Readings.

97. The daily observations of the Indus River discharges and guage readings were continued at Mithankot, Sukkur and Kotri all the year round, except at Mithankot where no observations were made for the latter half of June and the months of July and August as agreed upon with the Punjab authorities. The observations for velocity were taken from a boat or power launch which had fitted to it a boom and solid rod for lowering
the meter to the required depth. At Kotri during the low water season, the meter was lowered by means of the newly devised vertical rod. The vertical rod is simpler and more accurate than the solid rod, as the required depths are obtained directly and without the help of the boom. The new method is being tried at Kotri during the present abkalani season by means of a rack and pinion arrangement. If successful it is proposed to replace the boom and solid rod arrangement at the other discharge sites by this vertical rod arrangement. Gauge readings of the river were observed daily at 9 stations, twice a week at 6 stations and once a week at 6 stations.
98. The gauges are maintained for the purpose of fixing the high flood levels to be adopted for river embankments, recording the changes in the level of supply at canal heads and observing any permanent change in the water levels of the river.

Scientific Works and discharges of the Indus.
99. The discharge and other scientific observations were continued at Sukkur and Kotri as usual. The results will be published in the Indus River Commission records. The total monthly discharge at Sukkur during the inundation season and the maximum, minimum and average discharges of the year compared with the results of the previous four years are as follows :-

| Month. | 1922-23. | 1923-24. | 1924-25. | 1925-26. | 1926-27. |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Cusecs. | Cusecs. | Cusecs. | Cusecs. | Cusecs. |
| June | 9,971,573 | 7,030,265 | 5,452,253 | 7,187,685 | 5,007,133 |
| July | 13,219,431 | 9,535,084 | 13,828,033 | 13,178,300 | 8,559,869 |
| August | 14,413,531 | 15,129,163 | 17,430,248 | 15,104,765 | 14,893,852 |
| September | 11,603,767 | 8,799,072 | 10,656,104 | 5,832,236 | 10,748,420 |
| Total | 49,208,302 | 40,493,584 | 47,366,638 | 41,302,986 | 39,209,274 |
| Average discharge | 403,347 | 331,915 | 388,251 | 338,549 | 321,388 |
| Maximum discharge | 591,797 | 633,466 | 750,000* | 645,107 | 607,226 |
| $\begin{array}{cr}\text { Minimum discharge June } \\ \text { to } \operatorname{September} & . .\end{array}$ | 168,815 | 112,600* | 91,000* | 106,653 | 122,193 |
| Minimum discharge observed throughout the year. | 32,449 | 29,356† | 30,330 | 24,785 | 25.534 |

${ }^{*}$ Interpolated discharge.
The discharge observations of the Indus at Mithankot below its junction with the Chenab were also taken as in the previous year.

## Fleet.

100. The S.S. " Fateh Mubarak" to which heavy renewals of bottom plates had been done last year, was fitted up with a new boiler. Other repairs and fittings required to make the steamer suitable for touring purposes were also carried out.

## Extensions and Improvements and Special Repairs.

101. The estimated cost of the works under these heads sanctioned or approved during the year, by the Indus River Commission for execution by the Executive Engineers and by the Commission is as follows :-

| Division. | Extensions and Improvements. | Special Repairs. | Total. |
| :---: | :---: | :---: | :---: |
| Indus Right Bank Circle. |  |  |  |
| Begari Canals Division | Rs. 7,231 | Rs. 37,980 | ${ }_{45,211}$ |
| Shikarpur Canals Division | 15,174 | 19,279 | 34,453 |
| Ghar Canals Division |  | 1,44,471 | 1,44,471 |
| Western Nara Division | 13,447 | 72,197 | 85,644 |
| Karachi Canals Division | 1,11,817 | 5,11,653 | 6,23,470 |
| Total | 1,47,669 | 7,85,580 | 9,33,249 |
| Indus Left Bank Circle. |  |  |  |
| Nasrat Canals Division . | 5,90,113 | $\ldots$ | 5,90,113 |
| Hyderabad Canals Division | 19,000 | .... | 19,000 |
| Fuleli Canals Division .. | 1,43,495 | .... | 1,43,495 |
| Total | 7,52,608 | $\ldots$ | 7,52,608 |
| Indus River Commission. |  |  |  |
| Karachi Buildings Division | 26,031 |  | 26,031 |
| Grand Total | 9,26,308 | 7,85,580 | 17,11,888 |

Works under the direct control of the Indus River Commission.
102. The total expenditure incurred and accounted for by the Indus River Commission was:-

|  |  |  |  | Rs. |
| :--- | :---: | :---: | :---: | ---: |
| Works | .. | . | .. | 10,360 |
| Repairs | . | . | .. | 28880 |
| Tools and Plant | .. | .. | . | 5,052 |
|  |  |  | Grand Total | .. |
|  | 44,232 |  |  |  |

## Erosion.

103. In the Shikarpur Canals Division during the last abkalani there was severe erosion opposite miles 18/2 to 19/5 of the Sukkur Begari Bund. A trenching bund to the Arain loop was constructed and a pumping plant installed so as to make it safe against a sudden rush of spill water in case the front bund was breached by the river. Erosion was also active opposite miles 27 to 29 of the Sukkur Begari bund, where the Satabani loop is the only line of defence.
104. In the Western Nara Division there was erosion opposite mile 100 to $100 / 5$ of the Nara bund. The new loop of 1926 is now the line of defence. There was active erosion also at the head of Western Nara and the river approached very close to the head regulator.
105. In the Karachi Canals Division owing to active erosion the river came very close to the last mile of the Thahimani Abad loop. A new loop called the Abad Mahro loop was therefore constructed.
106. Erosion was also active at the head of the Baghar Canal and as the angle formed by the Baghar Uchito bund and the left bank of the Baghar was in danger, a loop called the Belo Tanka loop was constructed across the angle. The Right and Left Banks of the Baghar have been raised and made up to full bund section and the two banks have been joined by a connecting bund with a regulator in it.

## 6. Lloyd Barrage and Canals Construction. General remarks.

107. The year under report is the second full working year for the execution of the Lloyd Barrage and Canals Scheme and was devoted to further surveys, levelling, aligning and designing of canals, excavation of canals both by dragline machines and manual labour, and preparation of detailed plans and estimates for earthworth and buildings. As regards the construction of the Barrage, the year was devoted to the completion of the service works and preliminary arrangements, collection of reserves of stocks of various materials such as lime, stone and the erection of all plant required for work in the river Indus. The first season's programme of permanent works in the river was carried out with complete success and the cofferdams, the largest of their kind ever constructed in India, were removed so that the floors of the five great canal head regulators are now permanently submerged with the main river flowing over their aprons. The masonry works constructed during the year on both banks of the Indus and which form part of the flanks of the Barrage proper have a combined river face of over 2,700 feet in length exposed to the main current of the river.
108. The whole scheme is divided for the purposes of this report into 4 sections:-
109. Right Bank Canals.
110. Left Bank Canals.
111. Eastern Nara Works.
112. The Barrage Works.
113. The Right Bank Canals are in charge of the Superintending Engineers, North Western and Western Circles. They comprise (a) The North Western Perennial canal and its branches (b) The Dadu canal and its branches and (c) The Central Rice canal and its branches.
114. The Left Bank Canals consist of the Rohri Canal and its branches and the two Khairpur Feeders East and West and, except the last named small canal which is in charge of the Superintending Engineer, Lloyd Barrage Circle, are in charge of the Superintending Engineer, Rohri Canal Circle.
115. The Eastern Nara Works consist of the Eastern Nara, the Jamrao Mithrao, Thar and Hiral canals and are in charge of the Superintending Engineer, Eastern Nara Circle.
116. The Barrage with the river training works and the head works of the main canals is in charge of the Superintending Engineer, Lloyd Barrage Circle.

## North Western Circle.

113. During the period under review, the work done consisted of lockspitting D.I.L. ex the North Western Perennial Canal, survey, lining, lockspitting of boundaries of land of the minors ex the Dadu Canal; ranging centre line, aligning centre line with theodolite, chaining, levelling, check levelling, nicking out centre and boundary lines along Shahdadkot and Ratodero branches and their distributaries and minors; detailed survey of all minors and distributaries $e x$ the Khirtar branch ; ranging and laying on the ground of the command boundary lines between the Shahdadkot and the Ratodero branches and along North Eastern and Gandhaka Valley lines; close contour survey of the remaining portion under the Begari Remodelling Scheme and the preparation of a rough project for Remodelling the Begari Canal; surveying and preparing a project for the Sultanwah; providing service roads and fixing boundary stones. Good progress was made with the excavation of the main canals and their branches by means of dragline machines supplemented in portions by manual labour. Dressing of spoil banks, inspection paths and side and bed slopes were carried out side by side with the excavation. A light railway to feed the machines was laid in a length of 10 miles. A tube well for feeding the boilers of the dragline machines was sunk on the North Western Perennial Canal and the sinking of two more tube wells was nearly completed.

The total quantity of earthwork done in this Circle to the end of the year was about 17.33 crores cubic feet against the approximate total quantity of $71 \cdot 20$ crores cubic feet (Project) to be done to complete the work. Good progress was made with the construction of buildings. Miscellaneous work consisting of taking subsoil water level observations, acquisition of land, preparing detailed plans and estimates of earthwork of main canal and branches and for a protective bund along the Khirtar Branch was also carried out.

North Western Perennial Canal at Bagarji, mile 8.
Designed Discharge
Bed width ...
Depth of water
...
$\cdots \quad \cdots \quad \cdots \quad 5,152$ Cusecs.
.
$\cdots \quad . . . \quad 10.2$ Ft

Central Rice Canal, below Ruk at mile 20.

Designed Discharge ... ... ... 9,960 Cusecs.
Bed width ... ... ... ... ... 237 Ft
Depth of water $\ldots$..... ... .... $\quad 11.75 \mathrm{Ft}$.

## Western Circle.

114. Further investigations were made in the alignment of the main canal systems, branches and distributaries and in connection with the Manchar Drainage Scheme. The design of the Warah branch and the final alignment of several distributaries ex the Dadu Canal were completed. The Johi Branch was realigned to run along the alignment of the Flood Protective Bund. Preliminary investigations for suitable alignments of distributaries and minors ex the Johi branch were made and final alignments decided in the case of some of them. The alignment of the Central Rice Canal was re-adjusted wherever necessary and the demarcation of boundaries by lockspitting was completed. Detailed cross sections of the Ghar, Dhamrao and Mehar branches were co pleted in a length of about 80 miles for preparing detailed working earthwork estimates. Level ling and chaining of about 30 miles of existing channels to be utilised as branches and distributaries was completed and 25 miles of new distributaries were investigated for the purpose of locating suitable alignments. The question of utilizing a certain length of the new Western Nara Cut having been decided, chaining and levelling and construction of pillars were completed on that new link. The investigation, including contour survey for the most suitable alignment for a bund round the Manchar lake and the flood protective bund was completed. An alternative alignment for draining the Manchar lake on the south-west of the town of Sehwan was investigated. Borings were made to find out a suitable site for a regulator on the Aralwah at Sehwan. Surveys were carried out of the Sol Nai and Dadeji Wah and of the great Gaj Nai in Baluchistan Territory beyond the Khirtar range to investigate the possibility of daming up this Nai at its exit into Sind.
115. Owing to the peculiar nature of the country through which the Dadu Canal and the Central Rice Canal pass, the excavation of these canals is being done partly by mechanical excavators and partly by manual labour. Large and intermediate class excavators are employed on excavating these canals and small size machines on the tail portion of the Dadu Canal and the Warah and Johi branches. The total quantity of earth-work done in this Circle to end of the year was 18.83 crores cubic feet against an approximate total amount of 129.30 crores cubic feet (Project) to be done to complete the work.
116. The buildings under construction were completed and construction of other buildings was taken in hand. Land already notified was taken possession of and land plans and statements for further areas of land required were prepared. Sub-soil water level observations were continued. Detailed earthwork estimates for the Central Rice Canal and for the Warah Branch were nearly completed, and a programme of bridges and regulators required was prepared.

## Rohri Canal Circle:

117. The surveys of the main Rohri Canal, Khairpur Feeder East, Naulakhi and Mehrabpur Branches in the Rohri Canal No. I Division were completed. Similarly the detailed surveys of distributaries ex the

Rohri Canal miles 60 to 80 ex Sehra and Nasrat branches and main drain No. 2 in the Rohri Canal No. II Division, and survey of main drains Nos. 3 and 4, minors ex the Dad Branch and the main canal and the proposed Government channels in the Rohri Canal No. III Division were completed. In the Rohri Canal No. V Division the preliminary and detailed surveys of the distributaries and minors ex the main Canal and of drains were completed. The detailed designs of branches and of distributaries and minors ex several systems were completed while those for the remaining distributaries and minors were in hand. The preparation of earthwork estimates for main canal, branches, etc., was taken in hand.
118. Good progress was made with the excavation of earthwork, partly by mechanical excavators and partly by manual labour. The pair of class 320 Bucyrus dragline excavators excavated 7.03 canal iles of the head reach of the main canal. Similarly the two class 300 Ruston machines excavated the main canal near Meharabpur in a length of 10.2 miles and the two class 20 Bucyrus dragline machines excavated the full length of 13 miles of the Khairpur Feeder East. In the Rohri Canal No. V Division one class 20 Bucyrus dragline excavator was employed in excavating the Hyderabad branch and Escape No. III while the two small machines worked on the main Rohri Canal. An order for eight more Diesel driven dragline excavators was placed and these have arrived and are in course of erection. The work by manual labour is proceeding satisfactorily. The total quantity of earthwork done in this Circle to the end of the year was 23.44 crores cubic feet for main canals and branches against an approximate total amount of $145^{\circ} 00$ crores cubic feet of earthwork (Project) to be done to complete the work.
119. A number of buildings were completed and good progress was made with those under construction. Good progress was also made with the acquisition of land.

## Eastern Nara Circle.

120. The Survey and investigation having been completed, the project (a) for remodelling the Mithrao Canal (b) for a new cut from miles 62 to 71 and (c) for the new distributaries ex the main canal was taken in hand. The project which is nearly completed, has been held in abeyance pending the collection of figures of cultivation which is being pushed on. This will be followed by a project for remodelling the Jamrao Canal, information in connection with which has been collected. Earthwork estimates for Samarjo Branch, distributaries ex Khipro Canal, Sufi branch and Hiral canal and the flood diversion bund from Khipro Weir to Thar Weir were sanctioned, while an alternative project for the Naokot branch and its distributaries and earthwork estimates for the Thar Canal system, the Hiral Canal and its distributaries, widening the Nara from R.D. 81 to 270 and for cutting bends in the Nara were prepared.
121. Good progress was made with the excavation of earthwork partly by mechanical excavators and partly by manual labour. The excavation
of the Khipro Canal ex the Eastern Nara in a length of 21 miles and of thé Samarjo and Nabisar branches and distributaries ex 10th mile Khipro: Canal in a length of 26 miles was completed. The total quantity of earthwork done in this Circle to end of the year is $10^{\circ} 20$ crores cubic feet for main canals and branches as against the approximate total amount of 119.20 crores cubic feet (Project) to be done to complete the work.
122. Containing banks in a length of 57 miles on the right and left banks of the Nara above the Jamrao head and from Jamrao head to MakhiWeir were completed and brought up to proper formation level and those of the Flood Diversion Bund from Makhi Weir to Khipro Weir were in progress. The question of embanking the Nara to prevent wastage of water was investigated.
123. All buildings under construction were completed. Lockspitting of boundaries and digging trenches for defining land to be acquired were completed for almost all works under construction as also for those' for which plans and estimates had been sanctioned.
124. The total amount of earthwork contemplated in the project estimates on the main canal, branches and Nara embankments is 500 crores. cubic feet. The quantity to be done according to the working estimates will be approximately 425 crores cubic feet and the total quantity done to end of March 1927 is about 70 crores cubic feet. The quantity done represents a column 1.5 miles high with 100 yards sides.
125. The total capacity of the 32 dragline excavators which have been working during the year under report is 54 tons of earthwork excavated and dumped per minute, or 0.9 ton per second night and day for $5 \frac{1}{2}$ dayss a week and 250 days in the year.

## Lloyd Barrage Circle

126. Township.-To facilitate execution of works two townships one on either bank of the river, have been constructed, the larger of the two townships being on the right bank. The right bank Township is provided with a hospital with 24 beds, bazaar, market, shops and two institutes,' one for officers and the other for staff, while the smaller township on the left bank is provided with dispensary, bazaar, market, shops and a small institute for the staff. During the period under report bungalows for 18 officers of and above the rank of Assistant Executive Engineers and 276 quarters for officials of Assistant Engineers' rank and below and '161 quarters for menials were completed and these are all fully occupied. In addition 89 blocks of cooly lines for semi-skilled labour on both bánks of the river and two large blocks of offices on the right bank to accommodate all officers who have their headquarters at Sukkur and a small block of offices for sub-divisional officers on the Left bank were completed. Roads are provided in the townships for communication between the various: bungalows, quarters and offices. All bungalows and quarters on the right and left banks and markets, shops, hospital, dispensary and institutes: are provided with electric lighting. Street lighting was installed on all
completed roads and brought into use. Schemes for an independent watersupply for the two townsiips are in hand. On the right bank a $10^{\prime \prime}$ tube well is provided for the supply of drinking water. An Inspection Bungalow has been constructed in the Township on the right bank for the use of officers and visitors on business connected with the Barrage.
127. Railways.-In order to enable rapid and economical transport of materials and stores, a fine net-work of railway track has been constructed with numerous sidings at the stores, quarries and cofferdams. A station and exchange sidings are provided for transferring waggons from the North-Western Railway to the Barrage Railway on each side of the river. The total length of the main line and sidings laid at the end of the year was: 15 miles on the right bank and $17 \cdot 5$ miles on the left bank.
128. Quarries.-The three quarries are equipped with the most up-to-date mechanical appliances each with its own power plant for compressed air and necessary pneumatic tools, workshops, dispensary, works water supply and necessary accommodation for subordinate staff and labour. The Sukkur and Kohistan quarries produce rubble stone while special large-sized stones required for ashlar work on the Barrage and regulators are obtained from the Rohri quarry. The quarries are working at high pressure not only to meet the present demand but also to maintain an adequate reserve of stock of all kinds of stores.
129. Fleet.- The fleet consists of two syction dredgers for excavation of foundations in the river, three paddle tugs for towing barges and other craft and for conveying labour across the river, pontoons for pile drivers and pumping setś, electric derrick cranes, heave-up boat for lifting heavy anchors and moorings, steel barges of 100 ton capacity and motor launches for conveying staff, labour and light materials across the river. The dredger 'Ruk' which was at first employed on excavating the Eastern Nara Cut was transferred on to the work of filling of the left bank wharf with silt from the river bed by means of a floating pipe line and a terminal pontoon after which it started dredging the foundations for the regulators on the left bank. The dredger 'Rohri' after being converted for oil fuel was first employed on filling the right bank wharf area and then on dredging the foundations on the right bank. The excavation being close to or actually within the line of the natural banks of the river it was found that in these banks were buried hur خeds of palm trees which had been used in past years as "Khuadas' " and had since been completely obliterated by the deposits of the river. Moreover below these and at a depth of about 20 feet below the highest flood level there was a solid mat of brushwood about three to five feet thick buried in the river bed. These palm trees and brushwood were entirely unexpected and gave immense trouble to the dredgers whose output when working under these conditions was considerably reduced. The result was that the dredgers took very much longer than anticipated to dredge the foundations and eventually had to be removed from the cofferdams before they had completed the excavation because the river had fallen so low in the meantime that there was barely sufficient depth of water to float them. They had, however, done the greater part of this difficult work leaving in
most places on the left bank only sand below to be excavated: On the: right bank, however, a larger slice of the brushwood mat was found still. undone and this gave great trouble to the contractor doing the excavation by hand labour. The pile driving and pumping plants were employed on cofferdams for regulators and were in continuous use day and night.
130. Wharves.-The deep water wharves 600 feet long having curved: frontages at the lowest stages of the river were completed. The face of the wharves is formed of 40 feet interlocked steel sheet piling driven into the river bed and bank and thus each encloses an area of about $1 \frac{1}{2}$ acres of sloping river bank. The top of the wharves is about 4 feet above' the highest flood level and carries three lines of broad gauge railway. The wharves are used for loading barges with materials from the bank.
131. Cofferdams and Head Regulators of Canals.- The actual construction of the regulators for the canal heads which form the flanks of the Barrage proper was commenced in the autumn of 1926 as soon as the river was low enough in velocity and level to make the pile driving practicable for these exposed works. The cofferdams constructed of interlocked steel sheet piling are probably the largest ever constructed. The cofferdam on the left bank is 1,700 feet long, the upstream end being 200 feet wide and the downstream end 700 feet wide. The cofferdam on the right bank is 1,350 feet long, 200 feet wide on the upstream and 600 feet wide on the downstream ends. The former encloses an area of about 19 acres and the latter of about 13 acres. Inside these cofferdams the foundations for the canal regulators and the wide masonry aprons have been excavated and all masonry laid in the dry. The founding of the five of the seven canal regulators above the Barrage was successfully completed during the year.
132. Plant.-Numerous items of Special plant and machinery were purchased during the year through the Director General of Stores, India Stores Department, London, and the Chief Controller of Stores, Indian Stores Department, Simla. A well-equipped engineering and woodworking shop with electric power and with a small foundry for iron and brass castings on the right bank and a smaller combined engineering and wood-working shop with electric power on the left bank were kept fully employed. They carry out repairs to machinery employed in other Circles as well as in the Barrage Works proper, and also miscellaneous work such as fabricating special piles, steel flumes and trestles for the pumping plant, etc. To meet the heavy demand for mortar, fifty $8^{\prime}$ diameter electrically driven mortar mills were provided on both banks and these have been found just sufficient to cope with the minimum demand for mortar. Six more mills have since been erected to give a small margin for breakdowns. For the purpose of moulding the concrete blocks required for the protection of the river bed on the downstream side of the Barrage and the canal beds below the regulators, two complete sets of plant were received, erected, tested and brought into use. Each set of plant consists of a 12 ton 60
feet span " Goliath " crane, a travelling mixer gantry with concrete mixer, a travelling rump for $2^{\prime}-0^{\prime \prime}$ gauge waggons and hoppers and elevators for stone, sand, lime and cement. The steel moulds used for casting the large and small blocks $10^{\prime} \times 5^{\prime} \times 3^{\prime}$ and $5^{\prime} \times 3^{\prime} \times 1 \frac{1}{2}^{\prime}$ respectively which have been made in India have proved thoroughly satisfactory in use. The core boxes for taking the heads of the lifting hooks are being made of reinforced concrete designed after careful experiments and have also proved thoroughly satisfactory and economical. The Power House plant on the right bank with six Diesel engine alternative sets of a total capacity of $2,350 \mathrm{~K} . \mathrm{W}$. worked most satisfactorily. The total units generated during the year were 617,000 at a cost of $3 \cdot 5$ annas per unit including depreciation, repairs and running expenses. There are about 15 miles of high and low tension transmission lines, comprising approximately 72 miles of copper conductors, 10 miles of guard wires and 390 steel poles complete with insulators and lightning arresters, etc.
133. Other works.-One tower on each bank to command fully all regulators was built and special 8 inch theodolites fixed thereon. From these towers the exact alignment of every part of the regulators can be set out and they are high enough to sight over the top of the highest point of the regulator bridges when completed. Similar but much larger towers will be built during the next year at each end of the Barrage for aligning that work. The two special 12 inch theodolites for these towers have been received.
134. Experiments on hydrualic lime.-Exhaustive experiments have been carried out in the production of 'fat ' and hydraulic lime from local lime stone and the results have been extremely satisfactory.
135. Silt Observations.-Sounding and silt observations on cross sections from the cantilever bridge to the Barrage were continued.
136. Telephones.-Telephones were installed on both banks of the river in the Township areas to facilitate execution of works as also along some of the proposed canals and branches on both the banks.
137. Rectangulation survey.-A rectangulation survey of the area under command of the canals of this Scheme, excluding Khairpur State, is being carried out by the Survey of India at the expense of the project. This work has as its ultimate object the standardization of the size and shape of each survey number, each " number" being 16 acres in area. The first season's work was commenced during the year under review and it is expected that the Survey of India will complete its part of the taskthe splitting up of the commanded area into main rectangles 2.5 miles by $1 \%$ miles or 2,560 acres-by the year 1930. The further subdividing of these main rectangles into smaller ones down to the 16 acre plots will be carried out by the staff under the Revenue Officer of this Scheme.
138. Land.-During the year over 11,000 acres of land were acquired at a cost of over Rs. 13 lakhs, at an average rate of Rs. 112 per acre.
139. New Divisions.-During the year two new Divisions were opened, viz., the Draglines Division and the Central Designs Division.

## xxix

140. Hospital and Dispensaries.-A well-equipped hospital with 24 beds and quarters for the medical establishment on the right bank and a dispensary with quarters for the medical staff on the left bank, a first aid. dressing station with compounders' quarters at the Kohistan and Sukkur quarries and a dispensary with accommodation for a resident compounder at the Rohri quarry were opened for the treatment of the staff and labour. Dispensaries have also been opened at several places on the canals for the treatment of the staff and workmen employed on the dragline excavators. An Inspecting Medical Officer has been appointed to supervise the work of the dispensaries in this administration. Pending more permanent arrangements the Civil Surgeon, Sukkur, has been appointed Chief Medical Officer, Lloyd Barrage and Canals Construction.
141. During the period the works at Sukkur and Rohri were visited by His Excellency the Governor of Bombay, the Honourable Member, Finance Department, the Honourable Member, General Department, and the Secretary to Government for Irrigation in November 1926 and by the Honourable Member, Revenue Department, in January 1927.

## Withdrawals of water from the river Indus and its tributaries.

142. The Government of India have given an assurance, as mutatis mutandis they have the Punjab Government, that no new major irrigation project in the Punjab will be sanctioned until the Government of Bombay have received timely notice and full information as regards the scheme in hand and have been given the opportunity to represent their case should such project appear to them to be unfavourable to their interests. The Thal Canal Lesser Project, 1925 which was referred to the Government of Bombay in accordance with the assurance above was objected to as stated in the previous year's Report. The experimental Thal Canal Project has since been abandoned by the Punjab Government. In the year 1926 the Government of India forwarded another scheme called the Jalalpur Hydro-Electric Pumping Project estimated to cost Rs. 61,22,400 and enquired whether there was any objection to its being undertaken. The main features of the Scheme are :-

|  | Acres |
| :---: | :---: |
| (1) Gross area commanded | .. 167,824 |
| (2) Culturable area commanded | .. 134,258 |
| (3) Proposed annual irrigation | .. 100,695 |
| (4) Proposed kharif irrigation out of (3) | .. 40,277 |
| (5) Proposed rabi irrigation out of (3) .. | .. 60,418 |
| (6) Proposed Kherif full supply discharge | 505 cusecs. |
| (7) Mean discharge required in rabi | 380 |

This Government have agreed to the Government of the Punjab being allowed to proceed with the project.

## 7. Miscellaneous.

143. Plantations.-Existing plantations on canals and bunds were carefully looked after. The work of planting new trees in some Divisions was continued.
144. Irrigation of Cotton.-No Egyptian cotton was sown in the Indus Left Bank Circle during the year. The following table shows some details regarding waterings given to indigenous cotton :-

| Name of Division. | Lift lands. |  | Flow lands. |  | Date of last watering. |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | No. of waterings. | Interval between. | No. of waterings. | Interval between. |  |
| Hyderabad Canals .. | 6 to 8 | $\ldots$ | $\ldots$ | $\ldots$ | 1st October 1926. |
| Fuleli Canals |  | 12 to 52 days | $\ldots$ | $\ldots$ | 30th September 1926. |
| Eastern Nara , .. | $\ldots$ | $\ldots$ | 4 to 7 | $\ldots$ | $\frac{12 \text { th }}{1926} \text { October }$ |
| Northern Jamrao Canal | $\cdots$ | $\ldots$ | 6 to 9 | $\ldots$ | $\begin{aligned} & \text { 1920. Novemter } \\ & \text { 27th. } 1926 \text {. } \end{aligned}$ |
| Southern Jamrao Canal | 5 to 8 | $\cdots$ | 5 to 7 | $\ldots$ | Lift from 23 rd October 1926 to 6th November 1926 and flow between 21st August 1926 to 27th November 1926. |

## III. Deccan and Gujarat.

## 1. Northern Circle.

General remarks.
145. The year was marked by plentiful and well distributed rainfall. The replenishment in the canals and tanks was very good and irrigation revenue during the year considerably exceeded that realised in the preceding one.
(i) Works for which Capital Accounts are kept.

Hathmati and Khari Cut Canals.
146. The rain started in the month of May, but the regular monsoon commenced at the end of June and lasted till nearly the last week of September.

The rainfall gauged at Ahmedabad and Prantij during 1926-27 was 51.38 and 33.66 inches against the average of 27.93 and 28.26 inches respectively for the last 30 years including the year under report.
147. There were floods in the Hathmati river on the 4th, 9th and 12th July. The river began to flow on the 4th July and from that date water was diverted into the canal, which continued to flow up to end of March 1927 with two breaks, when the canal was temporarily closed in order to head up the water at the head and to let it in with a rush. The Bokh reservoir was filled from the canal wateŕ to R. L. $339 \cdot 10$ by

30th August. The water entering the reservoir was let down through the Bokh Vehelo into the Khari and the water level was maintained at R. L. 339 up to 2nd October, when the regular draw-off commenced and the reservoir got empty on the 12th November 1926. From 4th to 31st July some water was diverted from the Hathmati Canal to the Bhojwa channel for the use of the Khari Cut and the Khari Sluices and then the supply was stopped as water was required for irrigating the rabi crops on the Hathmati Canal.
148. There were only 79 acres of Kharif irrigation on the Hathmati Canal. All this area was planted with rice. Owing to scarcity of water in recent years people have taken to growing dry crops and so the area of rice crop was less this year. The average discharge at the head of the canal was 188 cusecs, out of which 139 cusecs were given to the Khari Cut and Khari Sluices via the Bhojwa channel and the Bokh feeder. In the rabi season 3,462 acres were irrigated by canal water. Remission of Rs. 3 was granted during the rabi season on account of failure of crops.
149. The Chandola tank which is fed by the Khari Cut Canal taking off from the weir at Raipur on the Khari River remained full up to the end of September and water was given for irrigation from 1st October.
150. The Khari river was in flood on the 9th and 15th July and on Ist September. As there was very heavy rainfall in the area on the Khari Cut Canal almost all rice was transplanted on rain water and hence there was no need of water up to 1st October 1926, when the demand commenced for superior variety of rice. Inferior yuality of rice had enough water at many places and it needed only one watering at some places. The area irrigated on the Khari Cut Canal was 5,477 acres. Owing to past experience of shortage of water people cropped early variety of rice and so nearly an equal quantity of crop was raised without canal water. In consequence of this, much water from the canals ran to waste. The Bokh water was all used up before the 16 th November and since the natural flow of the Khari at Raipur amounting to about 25 cusecs at the end of November was not allowed to be taken into the cut there was no rabi irrigation on the Khari Cut from Canal water. The little irrigation that was done in this season was mostly from tank water. The water in the Khari river did not reach the Kalambandhi villages, the whole of it having been wasted in absorption through the sandy bed of the river from Raipur to some 10 miles below it. Remission of Rs. 46 was granted during the year on account of failure of crops due to disease; Rs. 2,372 was the usual himayat deduction.
151. The total area irrigated and the gross assessment on the Hathmati and Khari Cut Canals during the year were 9,286 acres and Rs. 56,459 against 2,306 acres and Rs. 20,029, the average.

## Tanks in the Kaira Collectorate.

152. The area irrigated and the gross assessment including miscellaneous receipts from all sources on the Wangroli, the Tranza

Nagrama, the Savli and the Saiat Tanks compare with the average as under:-

| Name of tank, |  |  | 1926-27. |  | Average. |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Area irrigated. | Gross assessment. | Area ingated. | Gross assessment |
|  |  |  |  | Acres. | Rs. | Acres | Rs. |
| Wangroli Tank | . | $\cdots$ | 1,997 | 9.339 | 536 | 3.419 |
| Tranza Nagrama | .. | $\cdot$ | 158 | 1.336 | 4 | 1,033 |
| Sayli | .. | - | 2.583 | 9.910 | 471 | 2,688 |
| Saiat | .. | . | 890 | 4,458 | 387 | 2,469 |

The replenishment received in all the tanks in the Kaira District was sufficient to meet the demand for irrigation.
153. The storage of the tanks was utilised in irrigating the kharif crops consisting mainly of rice. The demand for water for this crop was heavy and was met from the supply available in the tanks by a judicious and economical distribution. Water was available for rabi, the demand for which was heavier than that of the previous year. The tanks were maintained in good order during the year under report at a cost of about Rs. $15,100$.
154. Futelao Tank.-The Futelao Tank at Nanikharaj is situated at a distance of 4 miles from Dohad in the Panch Mahals Collectorate. The tank did not fill owing to the insufficiency of run-off from its catchment area. The rainfall recorded at the station was $23^{\circ} 09$ inches and the total run-off received in the tank was 3.79 M .cft. There was no kharif irrigation on this tank but the demand for water during the rabi season was much larger than the supply could cope with. About 65 acres of land were irrigated. The revenue realised amounted to Rs. 162 which is good in comparison with that of past years. The miscellaneous revenue including that from tank bed-cultivation, grass, etc., derived during the year amounted to Rs. 126-3-0. The tank as well as the canals were maintained in good order at a cost of Rs. 1,048.

## (ii) Works for which Capital Accounts are not kept. <br> Khari Sluices.

155. This year water was given to the Khari sluices according to the terms of the agreement between the Government and the people of Kalambandhi villages approved by the Commissioner, Northern Division. On account of very good rainfall from the beginning of July to the last week of September 1926, there was more than enough water in the Khari river during that period and the river bed was completely saturated so that enough supply was always available in the river for transplanted rice up to November 15th. On the 20th November the water in the river failed. All the reservoirs were almost full by the middle of November as no water from them was required for the kharif crops. Under the Goblaj tank, 636 acres of rice and 46 acres of rabi were irrigated. About

28 acres of rabi crop of Pansoli (Kalambandhi) village were also irrigated from this tank free of any charge. An area of about 134 acres tansplainted in the Kalambandhi villages not asessed to himayat was also irrigated from the canal water.

## Muvalia Tank.

156. The Muvalia tank filled to F.S.L. owing to good rainfall in the year under report the water having risen to R. L. 139. 15 . As the monsoon failed in the latter part of the year and the cultivators who grew late crops stood in need of water, necessary supply was given to mature their crops in the kharif season. As the tank was full the cultivators were persuaded to irrigate more rabi land and they did so with the co-operation of the department. They took full advantage of the water in the tank the result being that the record figure ever attained since the construction of this tank was reached during the year, since water was given to the Kharedi village in miles Nos. 9 and 10 of the Left Bank Canal for the first time in the life of the canal. The total area irrigated and the gross assessment were 1,182 acres and Rs. 3,645 against 823 acres and and Rs. 2,622 respectively, the average. The miscellaneous revenue amounted to Rs. 3,867 against the revenue of Rs. 1,815 of the preceding year. Out of the above Rs. 3,200 were realised for the $4 \mathrm{M} . \mathrm{cft}$. of water supplied to the B. B. \& C. I. Railway Company's Loco Shops at Dohad. The tank with its dam, canals and distributaries, was maintained in effcient condition at a cost of Rs. 4,479.

> Old tanks.
157. Improvements to 2 tanks in the Ahmedabad Division and 8 in the Kaira and Panch Mahals Division were carried out at a cost of Rs. 17,866 and repairs to 10 tanks in the Ahmedabad, 36 in the Kaira and Panch Mahals and 38 in the Surat and Broach Divisions were carried out at a cost of Rs. 42,350 .
158. The following important works were in progress during the year:Expenditure during the year Rs.
(1) Improvements to the Nava bund at Kerala, Taluka Dholka ..... 530
(2) Providing a regulator of two openings to the Amba tank at Kokhra, Mehmadabad762
(3) Constructing the tank at Pania, Mahal Jhalod ..... 3,887
(4) Constructing the Chharchhoda Ambli Tank,Taluka Dohad5,481
(5) Constructing the Warod Sapoi Tank, Mahal Jhalod
District Panch Mahals ..... 6,999
The following repair works were carried out during the year :-
(1) Repairs to the Kamalia tank at Satmna, Taluka Kalol ..... 500
(2) Repairs to the Ratnagar Tank at Savli, Taluka
Kapadvanj ..... 999
(3) Repairstothe Fata Tank at Iawa, Taluka Mehmadabad ..... 365
(4) Repairs to Gam Tank at Sandhana, Taluka Matar ..... 586
(5) Repairs to Gam Tank at Chatarsumba, Taluka Thasra ..... 799

## Tanks in the Kaira and Panch Mahals Collectorates-

159. The small irrigation tanks in the Kaira and Panch Mahals Collectorates filled to their full capacity, a few breaching owing to heavy and constant rainfall in the month of August. Requisite repairs were promptly carried out to the latter with a view to stopping further damage and preventing loss of water. The area irrigated during both the seasons in the Kaira and Panch Mahals Collectorates amounted to 2,360 and 3,600 acres respectively excluding the area assessed to Himayat. The revenue realised during the year amounted to about Rs. 10,941 in both the Collectorates.

## Drainage Channels.

160. The drainage channels in the Ahmedabad, Kaira and Panch Mahals and the Surat and Broach Divisions were maintained in good order at a cost of Rs. 7,288, 4,146 and 6,381 respectively.
161. Protective bunds.--The following bunds constructed in the past with a view to protect the cultivable lands from the inroads of the sea worked satisfactorily :-
(1) Bund at Wagrej and Bigri in Bulsar Taluka of the Surat District.
(2) Bund at Lakhigam.
(3) Bund at Kadodra.
(4) Bund at Harinagar
(5) Bund at Gandhar in the Wagra Taluka of the Broach District.
(6) Bund at Suva
(7) Bund at Dehej
(8) Bund at Islampur
(9) Bund at Nada
(10) Bund between Nada and Devla villages $\}$ of the Broach District. Reclamation Works.
162. Reclamation bunds existing near Hansot and Asarsa villages in the Broach District continued to assist gradually in reclaiming the salt land by siltation. During the year there was no extraordinary high tide as was experienced in the years 1920 and 1924 and practically no damage was done to the existing bunds except washing of side slopes here and there by the periodical high tides during summer. These damages were promptly made good.
163. The Protective and Reclamation works in the Surat and Broach Divisions were maintained and repaired at a total cost of Rs. 6,326 .

## 2. Central Circle. General remarks.

164. There are only a few irrigation works of importance in the Central Circle, viz., the Ekruk Tank, the Jamda Canals and the Krishna Canal. The rainfall in the catchment of the tanks and canals in the year 1926 was good as compared with that of the previous year.

## (i) Works for which Capital Accounts are kept.

Ekruk Tank.
165. The Ekruk tank supplies water to the town of Sholapur, the Mills and the G. I.P. Railway and also for irrigation. Under unfavourable
conditions of replenishment the tank is not able to meet all the demands made on it and consequently investigations are in hand for an additional storage reservoir to supplement the supply. The tank irrigated 3,692 acres as against 3,638 the average. The gross assessed revenue amounted to Rs. 1, 35,456 against Rs. $1,26,038$ the average. The increase inassessment as compared with the average was due to greater consumption of water by the Sholapur Mills.

## Jamda Canals.

166. The area irrigated on these canals was 1,039 acres against 1,129 , the average: The gross assessed revenue amounted to Rs. 11,435 against Rs. 7,402, the average. The increase in assessment was chiefly due to more amount realised from the sale of mango fruit.

## The Krishna Canal.

167. The existing Khodshi weir is a masonry structure built across the Krishna river. The capacity of the storage has been found insufficient to supplement the discharge of the Krishna river and to adequately irrigate crops dependent on the canal in the hot weather. A project, which includes the construction of a pick-up weir across the river Koyna and a feeder channel from that weir to the Khodshi weir for improving the supply is under consideration.
168. The area irrigated on the canal was 6,938 acres against the average of 10,365 acres and the gross assessed revenue was Rs. 50,788 as compared with Rs. 77,748 , the average. The decrease was due to sufficient and timely rainfall in the Kharif season and insufficient supply of water in the rabi season.
169. Other works.-The areas irrigated on the Ashti tank, the Pathri tank, the Shahada Channel, the Upper Man river works and the Mhaswa tank showed increases as compared with their averages. The decrease in the area irrigated under the Lower Panjhra river works as compared with the average was due to the conversion of all the Pathasthal land of Betawad village under the Betawad Channel into Jirayat and also to the very limited supply of water received in the tank during the year.
170. Total area and assessment.-The area irrigated on all the works was 30,182 acres and the gross assessed revenue Rs. $3,25,379$ as against the average of 33,947 acres and Rs. 3,37,363 respectively.

## (ii) Works for which Capital Accounts are not kept. .

171 The area irrigated under the bandharas in the Central Circle was 9,375 acres and the outlay on extensions and improvements and maintenance and repairs was Rs. 7,148.

## 3. Deccan Irrigation Circle.

General remarks.
172. The year on the whole was a favourable one. The monsoon opened well and there was timely rainfall throughout the months of June to September 1926.

The rainfall in the catchment of Lake Whiting and that along the Nira Left Bank Canal excepting a few stations up to Pandhara was satisfactory. The supply at Bhatgar being very ample due to the Nira Right Bank Canal not having yet developed, canal water was unrestrictedly given to all kinds of crops in all the seasons to the fullest capacity of the canal. There was a considerable fall in the rabi area due to there being no demand for rabi water outside the rabi leases and due to cancellation of certain rabi leases. The kharif area however showed an increase due to certain rabi leases having been exchanged for perennieal blocks and to greater demand for monsoon water outside of blocks and leases. As regards the Mutha Canals system, although the monsoon was very late, it was satisfactory both in the catchment of Lake Fife and in the canal tract. The rabi rains failed almost entirely in the canal tract, and consequently the demand for water for rabi crops was very keen and was complied with as far as was practicable.
173. In the Godavari Canals tract the rainfall was very evenly distributed from June to September with the result that the demand for kharif crops was much restricted. Owing to favourable rains during the rabi season there was less demand for canal water for rabi crops. The condition of sugarcane and other seasonal crops on the whole was satisfactory. The condition of labour was also satisfactory. The actual draw-off from the storage from Lake Beale commenced from 8th November 1926. On the Pravara Canals the rainfall conditions were very nearly the same as on the Godavari Canals. There was an ample supply of water in the storage reservoir at Bhandardara (Wilson Dam) and applications for seasonal and perennial crops were met in full. The condition of the seasonal and sugarcane crops was on the whole satisfactory. In the canal areas cotton as a diversified crop is showing signs of popularity over other crops. Groundnut of Japan big and Pondichery varieties have been finding favour with the cultivators as these contain a better oil percentage.
174. The Honourable Mr. (now Sir) Cowasji Jehangir, C.I.E. O.B.E., Member of the Executive Council of the Covernment of Bombay in charge of irrigation visited the Godavari Canals area on 18th October 1926 and gave prominent irrigators an interview at Kopergaon for discussion on the general question of agriculture and irrigation and the steps to be considered for the prosperity of irrigated tracts. The Panchayat system continues on distributary No. 1 of Harrison Branch and is working fairly well. Very little interest is being taken in this movement by the irrigators.
175. Some experiments are being continued on the Nira and Pravara Canals in entrusting the cultivators with the distribution of water to their fields. The most important of these experiments is being carried out on an area of about 450 acres on the Nira Left Bank Canal at Malegaon. The progress of these experiments is being watched with interest, but there seems little hope that sufficient local co-operation will be forthcoming to render any important development possible at present.
176. Since 1923-24 an attempt has been made to start local Irrigation Committees on some of the distributaries of the principal irrigation systems. In this also the response has been very meagre. After considerable efforts
and persuasion a few such committees have been formed, the working of which is being carefully watched. The main drawback to the formation and success of such committees is the unwillingness of the people to combine together and undertake the responsibilities and duties of management and control.
177. Their Excellencies the Viceroy and Lady Irwin inspected the Lloyd Dam at Bhatgar, the Pravara Left Bank Canal tract and the Effluent Farm and Hydraulic testing station at Hadapsar and evinced great interest in all they saw ; they graciously expressed their appreciation not only of the works carried out by Government for the benefit of the country but also of the enterprise shown by the Deccan cultivators in availing themselves of water thus supplied and in rapidly developing the irrigated tracts. The members of the Royal Commission on Agriculture also visited the Lloyd Dam. The Wilson Dam at Bhandardara was declared open by His Excellency the Governor of Bombay on the 10th December 1926.
(i) Works for which Capital Accounts are kept.
(a) Works in operation.

## Nira Left Bank Canal and Shetphal Tank.

178. This system forms part of a scheme which was one of the pioneer irrigation works in the Deccan and irrigates lands on the left bank of the Nira river. The canal protects a tract with an extremely precarious rainfall in the Poona District.
179. The original canal system consisted of-
(1) a storage reservoir at Bhatgar impounding $5,313 \mathrm{M}$. cft. of water (now submerged in Lake Whiting formed by the new Lloyd Dam).
(2) a pick-up weir at Vir on the Nira river about 17 miles downstream from Bhatgar.
(3) a canal about 100 miles long which commands a gross area of 2,74,447 acres of which some 60,000 to 80,000 acres are irrigated annually. The canal was designed to carry 450 ctt . per second, but the masonry works were built to admit of the discharge being raised to 760 cft . per second, in order to provide for its future enlargement.
(4) Shetphal Tank.-This tank is situated at the tail of the canal and is used for the purpose of storing part of the surplus monsoon flow in the river which would otherwise go to waste. The water so stored is utilised during the dry season. The capacity of the tank is 592 million cubic feet.
180. The capital outlay on the whole system is 66.45 lakhs of rupees, and the scheme is financially the most remunerative of the larger protective irrigation works now in operation in the Deccan. It has also enormously benefited a tract which in previous years suffered seriously from drought and famine.
181. During the year under report this system irrigated about 78,000 acres, yielding a gross revenue of about Rs. 11 lakhs, or a probable net revenue of about Rs. $8^{\circ} 08$ lakhs which works out to about 8 per cent. on
the capital invested, and is the same as the average for the preceding three years.
182. The "Block System" or "Perennial Block System" has been already mentioned and described in the previous Reports. This is a form of long term water lease first introduced on this canal and now being extended to other systems. In return for first claim on the supply of water for the irrigation of sugarcane on one-third of the area concerned and for other crops during the monsoon and rabi seasons on the remaining two-thirds of the area, the lesee binds himself to pay a fixed rate per acre annually, whether water is taken or not. There are at present about 19,600 acres under Block agreements on the main canal and about 1,200 acres on the Shetphal Tank.
183. Another form of long-term agreement in vogue on this and other canals is the "Eight months" lease," which mainly differs from the perennial block system in that it guarantees water during the monsoon and rabi seasons only. Yet another modified form is adopted on some canals and applies solely to rabi irrigation.
184. The guarantee of water for the more valuable crops is the attraction offered by these long-term agreements, and the advantages to the Department are the stability of demand for water during the critical seasons of rabi and hot weather crops and the certainty of a uniform return for the water supplied.
185. The area of 8 months' and rabi leases on the canal was about 26,200 acres and that on the Shetphal Tank was about 2,800 acres.
186. During the year under report the work of remodelling the canal was in progress. This work forms a part of the Nira Valley Development Project (1922). The total expenditure on this work was about Rs. 3.95 lakhs. The surveys for remodelling distributaries were also in progress. The work carried out during the year chiefly consisted of earthwork in connection with raising and strengthening of the banks.

## Mhaswad Tank.

187. This irrigation tankis formed by an earthen dam across the Man river, 9,000 feet long and 80 feet high at its highest point and has a storage capacity of $2,600 \mathrm{M} . \mathrm{cft}$. It is situated on the eastern border of the Satara District but irrigates lands in the Sholapur District. Though the capacity is considerable the supply of water is not very reliable. The area irrigated during the year was about 5,300 acres yielding a gross revenue of about Rs. 55,300 and realising a return of about 1 per cent. on the capital invested.
188. Proposals for utilising the average discharge of 100 cusecs from the existing Mhaswad Canal in order to supplement the discharge at the tail of the Nira Right Bank Canal are inder consideration and when these are carried out the Mhaswad Canal system will cease to appear as a separate and independent entity and will eventually merge into the Nira Right Bank Canal.

## Godavari Canals.

189. This was the first of the important irrigation works undertaken in the Central Deccan for the protection of areas liable
to famine. It was started in 1907 and completed in 1915-16 at a cost of a little over one crore of rupees. The system comprises-
(1) a storage reservoir, called Lake Beale on the Darna river, with a capacity of $8,818 \mathrm{~m} . \mathrm{cft}$.,
(2) a pick-up weir at Nandur Madhmeshwar on the Godavari river,
(3) two canals, the Godavari Right and Left Bank canals taking off from the pick-up weir. The Right Bank Canal is 69 miles long and serves the northern tracts of the Ahmednagar District. The Left Bank Canal is 48 miles long, and irrigates lands in the South of the Nasik District and the North of the Ahmednagar District. The maximum designed discharges of the Right and Left Bank Canals at the head are 384 and 228 cusecs respectively.
190. The development of irrigation on these canals is fully up to expectations and sugar-cane cultivation is steadily advancing. There are at present about 9,400 acres under block agreements on the Godavari Righ Bank Canal and about 6,600 acres on the Godavari Left Bank Canal.
191. The area of all crops irrigated by this systèm was just over 26,000 acres, yielding a gross revenue of about Rs. $5,07,000$ or a probable net revenue of about Rs. $1,68,000$ which represents a return of about $1 \frac{1}{2}$ per cent. on the capital invested as compared with the average of about $2 \frac{1}{2}$ per cent.

## Mutha Canals and Matoba Tank.

192. This irrigation scheme consists of -
(1) a storage reservoir at Khadakwasla called Lake Fife impounding 3,950 million cubic feet, and
(2) the Mutha Right and Left Bank Canals.

The water of the lake is used for supplying drinking water to Poona and for irrigation on both banks of the river by means of the Right and Left Bank Canals, which take off from the flanks of the dam itself. The Right Bank Canal is 70 miles long and the Left Bank Canal 18 miles. The capital cost of the scheme is about 65 lakhs of rupees.
193. The system irrigated about 19,000 acres during the year, and earned a gross revenue of about Rs. $3,62,000$ including earnings by the sale of water to Poona Cantonment and City ; the probable net revenue is about Rs. $2,08,000$ giving a return of 3 per cent. on the capital invested, which is the same as the average. The area of eight months or rabi leases under the Mutha Canals and Matoba Tank was about 400 and 1,700 acres respectively during the year.
194. The supply of water in Lake File is insufficient to meet the increasing demands for water supply for Poona and perennial crops on the canals and in order to provide adequate protection to the area commanded, a project is under investigation for increasing the capacity of the lake, either by raising the present dam or by constructing subsidiary storage dams in branch valleys. Proposals are also under consideration for enlarging the Mutha Right Bank Canal, there being a very keen demand for extension of irrigation in the Mutha Valley. The work done so far
consists in ascertaining the nature of foundations of dam sites by means of bores for the alternative dams and surveys for remodelling the canal.
195. The Matoba Tank is a small tank receiving its supply mainly from the Mutha Right Bank Canal during the monsoon months.

Kadwa River Works.
196. The Waghad Tank, with an earthen dam having a maximum height of 96 feet, is the main feature of this small scheme and supplies the Palkhed, Ojhar Tambat and Wadali Canals. The area irrigated during the year was about 5,000 acres, the gross revenue about Rs. 33,600 and the probable net revenue about Rs. 6,000 . This scheme needs in creased storage and the canals require some remodelling. The Investigations of a preliminary nature are being made.

> Girna River Works.
197. This is a small irrigation system in the Nasik Collectorate comprising a storage reservoir called Chankapur Tank and the Girna Léft Bank Canal about 19 miles long. The tank is situated on the Girna river, a tributary of the Tapti, and is formed by a masonry dam 140 feet high. The total area irrigated during the year was about 6,500 acres and the gross assessed revenue about Rs. 33,000.

## Pravara River Works.

198. This system comprises-
(1) a storage reservoir called Lake Arthur Hill on the Pravara river at Bhandardara, 29 miles by road from Igatpuri,
(2) a pick-up weir at Ojhar, 53 miles downstream from Bhandardara, and
(3) two canals named the Pravara Right and Left Bank Canals, 33 miles and 48 miles long respectively which take off from the Ojhar weir.
199. The Wilson Dam, which forms Lake Arthur Hill, was started in 1911 and has already been completed. The catchment area of the reservoir is 47 square miles, and the whole of the catchment is in the Ghats, which assures a good run-off. The dam, which is designed to impound water at a maximum depth of 270 feet, is about 1,600 feet long and is constructed across a gorge in the Pravara river valley. At present water to a depth of 260 feet can be impounded which gives a storage of 10,086 million cubic feet. This storage can be increased to 12,092 million cubic feet by the installation of automatic gates on the waste weir.
200. The pick-up weir at Ojhar is 890 feet in length. Silt has accumulated in the basin to such an extent that it now does not contain a full day's supply for both the canals. It is, therefore, proposed to increase the storage to a three days' supply and take measures to prevent further accumulation of silt by constructing a barrage or a syphon spillway with scouring sluices. As a result of preliminary investigation of the several sites it has been considered advisable to postpone consideration of this scheme till the site at Manglapur, which would act both as a supplementary storage and a balancing tank is thoroughly investigated.
201. The construction of both the Pravara Right and Left Bank Canals has been completed with the exception of a few buildings for residential

Wilson Dam at Bhandardara.

Wilson Dam at Bhandardara.
View showing architectural treatment.

Wilson Dam at Bhandardara.
View showing the completed dam.
purposes for the staff on the canal system. The construction estimate of the project was closed at the end of June 1926. The canals are now in full operation, and with the storage at Lake Arthur Hill completed, a full supply will be available which is expected to bring a greater area under irrigation than has hitherto been possible. The gross commanded area under these canals is $2,28,720$ acres, and they irrigate lands in Sangamner, Kopergaon, Rahuri and Newasa Talukas in the Ahmednagar Collectorate. The designed discharges of the Right and Left bank canals at head are 534 and 153 cusecs respectively and at tail 39 and 82 cusecs respectively.
202. The completion of the canals has brought about a rapid increase in the irrigated area. A large sugar factory owned by the Belapur Company and situated near Belapur Railway Station started operations in 1921 and the Company's area of sugarcane has risen from 550 acres in 1921-22 to 1,800 acres during the year. The concern will eventually have about 2,000 acres under sugarcane every year out of about 7,400 acres of gross area which the Company have acquired.
203. The area of all crops irrigated by the canals during the year was about 32,000 acres of which about 10,300 acres were under sugarcane as against 49,000 acres in the previous year. This falling off in area is chiefly due to a falling off in the rabi area caused by a favourable monsoon. The gross revenue was about Rs. $6,59,000$ and the probable net revenue will be about Rs. 3,77,000.
(b) Works under Construction.

## The Lloyd Dam at Bhatgar and the Nira Right Bank Canal.

204. This irrigation system, together with the remodelled Nira Left Bank Canal which will form an integral part of the completed scheme, will be the largest so far constructed in the Deccan. The canal passes through the Northern tracts of the Satara Collectorate and the Phaltan State but it will mainly benefit the Western portion of the Sholapur Collectorate, a tract notoriously liable to famine.
205. The project comprises the construction of a very large masonry dam at Bhatgar, known as the Lloyd Dam to take the place of the old Bhatgar Dam, a much smaller structure constructed some 40 years ago. The new lake will impound 24,198 million cubic feet of water and will supply both the old Left Bank Canal and the new Right Bank Canal, both of which take off from the pick-up weir on the Nira river at Vir, some 17 miles below Bhatgar. The Right Bank Canal will be about 107 miles long and end near Mohod in the Sholapur Collectorate.
206. The works were started in 1912 and though they passed through various vicissitudes consequent on the war the improvement made in the progress of construction in more recent years made it possible to commence irrigation from the new Right Bank Canal during the year 1924-25. A volume of about 5 lakhs of cubic feet of masonry was added to the dam during the year, bringing the total done up-to-date to about $212 \frac{1}{2}$ lakhs and leaving a balance of about $2 \frac{1}{2}$ lakhs to be done. The dam is practically completed with the exception of gaps where the electrical elevators were erected. Practically all deep cutting and high banks up to mile $106 \frac{1}{2}$
of the canal have been completed, with the exception of those close to certain masonry works in the Malsiras Division, which are in progress. All the masonry works down to mile 107 have been completed except a few aqueducts which are nearing completion. The progress on distributaries and branches is satisfactory and in accordance with the programme. The distribution system is being designed on up-to-date principles.
207. The whole perennial area under the canal has been carefully, surveyed and soil classification carried out before designing channels.
208. A large venturi meter has been constructed to measure and record the discharge of the main canal at its head and standing wave meter flumes are to be constructed at miles 48 and 79 , to measure the discharges leaving Phaltan State territory and at the end of the perennial section of the canal.
209. The total expenditure incurred on works alone during the year amounted to about 12.45 lakhs of rupees, bringing the total outlay on works up-to-date to about 296 lakhs of rupees, against the estimated cost of works of Rs. 384 lakhs.
210. During the year the area irrigated was about 26,500 acres yielding a gross revenue of about Rs. $1,93,000$.

## Nira Valley Development Project.

211. As the storage provided by the Lloyd Dam at Bhatgar will not suffice for the full development of irrigation on the two canals, an amplified scheme, viz., the Nira Valley Development project which provides for widening and remodelling the Nira Left Bank Canal and for building a new dam at Vir to supplement the supply from Bhatgar has been sanctioned by the Secretary of State. The additional works will cost Rs. $127 \frac{1}{2}$ lakhs and will enable the canal to show a greatly improved return on capital outlay. Pending the development of the Nira Right Bank Canal the remodelling of the existing Left Bank Canal has been put in hand so as to take full advantage of the extra storage at Bhatgar and the work is in progress.

## (ii) Works for which Capital Accounts are not kept.

212. These include numerous bandharas or weirs built across small streams having a good supply of water to raise the level of the water sufficiently to enable them to command the lands to be irrigated. In all there are about 300 of these small works in the Nasik Collectorate alone and a large number also exist in West Khandesh. The outlay on repairs and extensions and improvements of these works and small village channels amounted to about Rs. 29,000 during the year against Rs. 35,000 the average.

## 4. Southern Circle.

(i) Works for which Capital Accounts are kept.

## Gokak Canal.

213. Among the irrigation works in the Southern Circle, the Gokak Canal Ist Section and Storage Works at Dhupdal is the most important.

The system consists of a weir across the Chataprabha River at Dhupdal about two miles from the Hukeri Road Station on the Madras and Southern Mahratta Railway in the Belgaum District, 16 miles of main and branch canals and 36 miles of distributaries. The water level of the Dhupdal Storage Reservoir on the 1st of April 1926 was $17 \cdot 86$ feet. The level went down gradually and reached $5{ }^{\circ} 00$ on the evening of 31 st May. The lake practically remained at this level, i.e., nearly dry, till the evening of 8th June. The reservoir then commenced to get replenishment and overflowed on 28th June 1926. At the end of the monsoon the crest of the weir was temporarily raised by 4 feet. The work of fixing removable wooden shutters is done at the end of each monsoon and the shutters are removed before the advent of the following monsoon. This arrangement has now made it possible to conserve a far larger quantity of water at the beginning of the cold weather than before and thereby to bring more area under rabi cultivation. Full supply up to the raised crest, i.e., $26^{\circ} 00$ feet on the gauge, was obtained on 26th October. The crops got sufficient water for the whole season. The area of sugarcane was limited to 100 acres.
214. The cotton mills at Gokak were supplied with water as usual for which they have to pay to Covernment Rs. 14,313 annually. Owing however to insufficient replenishment the requirements of the mills were met only partially from 9th April to 19th June 1926, and a compensation of Rs, 1,592-14-9 was therefore paid to the Mills as stipulated in the agreement.
215. The arrangement of supplying water for pumping engines of the Madras and Southern Mahratta Railway at Hukeri Road Station was continued during the year at the rate of one anna for each engine watered and two annas for water supplied to the passengers per day. A sum of Rs. 368 was recovered from the Railway Company for the supply.
216. The total area irrigated during the year under the Gokak Canal was 12,244 acres against 11,854 acres in the previous year and 11,427 acres, the average. The increase is due to more demand for water on account of failure of rains in the rabi season.
217. The water rate assessed during the year was Rs. 80,136 against Rs. 76,728 of the last year and Rs. 62,762, the average. The increase is due to increase in the area irrigated.

## Dharma Canal.

218. The monsoon was not so favourable as it was expected to be. Water was admitted into the canal on 6th July 1926 and the canal ceased to flow on 28th November 1926. Crops under direct irrigation of the canal and also those under the tanks fed by the canal were in good condition due to judicial distribution of water.

> Other Works.
219. The remaining works are a few tanks irrigating from 50 to 600 acres and are situated chiefly in the Dharwar Irrigation Division.
220. Total area irrigated and assessment.-The total area irrigated on all the works was 19,826 acres and the gross assessed revenue Rs, 1,12,173 against 19,502 acres and Rs. 96,756, the average, respectively.

## (ii) Works for which Capital Accounts are not kept.

221. Most of the irrigation works under this head are in the Dharwar Irrigation Division. They supplement rainfall and irrigate rice whenever there are long breaks in the monsoon. Repairs to 108 tanks were carried out at a total cost of Rs. 62,166 , the average expenditure on such repairs being Rs. 57,923 . The total area irrigated by these small works was 90,748 acres and the irrigation share of the consolidated assessment amounted to Rs. 3,08,786.

## 5. Scientific Works.

## (a) Engineering questions that have arisen.

222. Observations to ascertain losses by evaporation and absorption were made by means of iron tanks in certain tanks and reservoirs and the results are published in the Annual Report of Supplies of water available for irrigation works, etc., for the year 1926.

## (b) Special Irrigation Division.

223. This Executive charge carries out experiments and research work in connection with the many problems met with in the scientific development of Deccan Irrigation.
224. The principal subjects handled are dealt with below :

Land Drainage.-It has now been proved that waterlogged lands can be drained and reclaimed at a comparatively small cost by means of a system of permanent drains; combined, in the first few years, with the restoration of the physical texture of the soil by means of surface-washing or 'leaching' of the salts in the case of salt-affected lands. The texture of the soil is revived by suitable initial plantation, green manuring, admixture of coarse vegetable matter, etc. Three such drainage and reclamation schemes have been completed, the areas of which aggregate 391 acres; the total cost was Rs. 59,844, the average cost per acre being thus Rs. 153. About 350 acres in these schemes are now under successful irrigation, and the land, formerly worth little or nothing, is now worth about Rs. 500 per acre. Co-operative financing of drainage schemes has been attempted but found practically impossible and the only solution appears to be for the work to be done by the State and a cess for the increase of irrigation facilities to be imposed.
225. The following Land Drainage Schemes are in progress:-

226. The idea of carrying out the work of Manjri Drainage Scheme on the Mutha Right Bank Canal by contribution has now been dropped and the work is now to be carried out at Government expense. Manjri Drainage Co-operative Society collected Rs. 4,000 towards the scheme, but could do no more towards financing it. In no other case was financial assistance, co-operative or otherwise, forthcoming to assist in starting such schemes, in spite of the fact that the success of those already carried out was patent and was fully recognised by the cultivators, who expressed a keen desire for further schemes to be carried out by Government.
227. For examining the possibilities of further drainage schemes detailed surveys of the catchments of nalas in the Nira, Godavari and Pravara Canals areas were carried out and the preparation of plans and estimates for these schemes is in hand.
228. In the case of the drainage scheme near Baramati, all the badly damaged area was acquired by Government and this, together with the old experimental area, totals 161 acres. Most of this area is now reclaimed. The problem of reclaiming salt lands and spoilt areas under various canals has now been practically solved.
229. Soil classification, etc.-The area classified during the year on the Nira Left Bank canal totalled 96,964 acres. The cost of the soil survey worked out to 10 acres to the rupee. Soft murum coarse soil was also distinguished from hard murum coarse soil which is a new and important refinement. Branch No. 1 and minor No. 7 of the Nira Right Bank Canal were surveyed during the year. On the Codavari Canals the soft and hard murum survey in Blocks Nos. 5 to 10, Culvert 29 area Dauch and Savalvihir areas was completed. On the Pravara Canals, Blocks 1 to 5 of the Right Bank and Block 1 of the Left Bank were classified, the areas being 12,000 acres and 2,200 acres respectively. Soil classification of the Mutha Right Bank Canal area was continued and an area of 54,000 acres was surveyed. The peculiarities of soil and sub-soil in places where good crops are obtained and in places where the soil is incapable of growing any crop were investigated and compared. The results obtained corroborated the last two years' experience, namely that crops respond primarily to the surface soil conditions and are not greatly affected by sub-soil conditions. It was also found that a good deal of coarse soil area was underlaid by soft murum capable of being turned into good soil, rendering possible an increase in the areas suitable for cane. A survey of such murum areas was started.
230. Soil physics.-It has been observed that a deflocculated soil with no salt appearing on the surface does not give good crops. In order to find out the cause, samples of the surface soil and subsoil were analysed mechanically. The results-showed that cane failed for the reason that the high clay contents in the surface soil prevented good air circulation and obstructed drainage. With a view to improving such deflocculated soils various types of fertilizers were tried on a small scale, a fixed amount of each being given to equal-sized plots. Conductivity tests and Chemical
analysis were carried out to investigate the periodical variation in the quantity of soluble salts in drainage water. Mechanical analyses and capillary tests were carried out to ascertain the physical conditions of various soils before and after drainage and treatment.
231. Well observations.-Observations of levels of water in wells are being made in the areas irrigated by the principal canals as well as in those likely to be irrigated in the near future.
232. Aquatic weeds.-The intensity and distribution of the different varieties of aquatic weeds in different canals were observed. Charts of the distribution of water weeds as they existed in March 1926 were prepared for the Godavari Right and Left, Pravara Right and Left, and Nira Right Bank Canals. The variety of weeds called Potomoge Tox Perfolitus is now dying out, while those called Potomogetox Peetinutus and Vilaneria are found in abundance in these canals. The growth of weeds has started in the Nira Right Bank Canal and has become less in the head reaches of the Godavari Canals. It is found that the greater the turbidity the less the weeds, indicating that light is an important factor.
233. Block formation.-Formation of perennial blocks on the Godavari Canals was continued during the year. The classification of areas has been modified to some extent to make the meaning of the different classes more clear. Index plans showing these classes by different colours were prepared for giving wide publicity to the classification of the areas. On these canals there are more than twice as many local block-holders as lessee block holders. The main principles in block selection were :-
(1) Unitisation, i.e., sanctioning blocks in multiples of $1 \frac{1}{2}$ acres (i.e., $\frac{1}{2}$ acre cane).
(2) Concentration-isolated blocks were refused permission and owners were induced to take up areas where blocks were concentrated.
(3) Areas which could not be commanded easily were refused permission; also shallow and coarse soils were not selected for blocks.
Suitability of areas for different crops of the several distributaries of the Nira Right Bank Canal was worked out and the discharges fixed.
234. Efluent scheme and crop experiments.-Effluent from the Poona City sewage is pumped to the Experimental Farm at Hadapsar, where it is diluted with canal water and distributed both to experimental fields and to private lands. It is satisfactory to be able to record that the effluent has proved a very valuable form of manure and one which the people greatly appreciate. It is observed that no deterioration in the physical condition of the soil is caused, and that the outturn from crops is in no way inferior to that obtained by other methods of manuring. The Effluent zone was extended to the whole of distributary No. 5 of the Mutha Right Bank Canal. The crops irrigated on effluent were 254 acres of sugarcane, 10 acres of other perennials and 12 acres of seasonal crops. The assessment charges of the effluent area for effluent alone were Rs. 28,452 and the average discharge of effluent for the year was 1.04 cusecs and thus the money value of the effluent worked out to Rs. 27,358 per cusec year as against last year's figure of Rs. 31,266 . The reason for the small reduction
in value was the reduction of the proportion of nitrogen content. Experiments were carried out to ascertain the effect of varying the interval between waterings and it was found that the 10 days' interval gave the best results. In rotation period the quantity of water applied was the same in all plots, but the period between waterings was $8,10,12$ and 15 days respectively. The results in order of merit were $10,15,8$ and 12 days.
235. Effluent analysis and water requirement experiments formed the main work at the laboratory at the farm. Experiments to find out the loss of ' N ' in the eflluent, if any, under various treatments, such as drainage, aeration, and transit in channels, are in progress. The farm served as a demonstration area for the irrigators of distributary No. 5. Demonstration plots were also opened in irrigators' fields to show that top-dressings are not necessary for cane in addition to effluent. Experiments were carried out in the water culture house for finding out the amount of water consumed, per pound of dry matter produced in the case of cane, and are being continued.
236. On the effluent farm a turbine of 6 Horse Power is installed on a fall of 10 feet occurring in an irrigation channel. By means of this power all the cane grown on the farm is crushed.
237. Hydraulic Experiments.-An up-to-date Hydraulic Testing Station was started in 1921 on the farm, where meters, measuring and regulating devices, modules, etc., for use on irrigation channels are tested.
238. Modules.-The most suitable module so far devised for canal outlets is the Gibb Module. This type is now being introduced on certain experimental distributaries. Where the canal supply fluctuates it is not desirable to use rigid modules such as the Gibb type, and under such conditions semi-modules, which are unaffected by variations in downstream water level, but give discharges varying slightly with upstream fluctuations of the water level are suitable. The question of designing semi-modular types of outlets, flume meter falls and meters were the subject of experiment at distributary No. 5, Mutha Right Bank Canal during the year.
239. Standing Wave Flumes.-The long-throated type of flume was adopted and a standard design prepared. A weir type flume, similar to the above except that the width of the flume was much greater in proportion to the depth, was also designed to suit certain conditions.
240. Falls on canals and distributaries.-Hitherto vertical falls were constructed on canals and distributaries where the slope of the land was excessive. A new design of fall has been worked out at the Station which consists of a sloping flume discharging into a downstream chamber in which the excess kinetic energy is dissipated by a standing wave or by baffles projecting from the bed. Experiments on standing wave flume meter falls were continued during the year. Some Spramex lining was done as a water-proof covering to the sides of Manjri channel and experiments were carried out to find the leakage in the stone-lined and concretelined channels.

## xlviii

241. The following models were constructed in reinforced cement* concrete for the Presidency Agricultural Show :-
(1) Crump Adjustable Proportional Module;
(2) Kirkpatrick flume;
(3) Kirkpatrick orifice with guides;
(4) Standing Wave Pipe Outlet ;
(5) Crump Standing Wave Flume;
(6) The model of Manjri Drainage Scheme ;
(7) $74 \frac{1}{2}^{\prime \prime}$ Standing Wave Flume meter fall.
242. A model of the automatic gates at Khadakvasla has been constructed to ascertain the discharge for various spans when only one gate is open, and when 2 gates, 3 gates, etc. are open. The discharge from two gates alongside flowing simultaneously is appreciably less than the sum of the discharges of the two gates flowing separately.
243. Syphon Spillways.-Experiments on a large scale have been carried out in connection with syphon spillways, which are devices designed to carry off floods from storage works with high efficiency and without making use of any mechanical gates.

Small model syphons $4^{\prime}$ and $10^{\prime}$ in height were erected at distributary No. 5 and experiments were carried out.

## (c) River Gauging.

244. Wherever there is any possibility of developing irrigation, arrangements have been made to gauge the rivers concerned and record the rainfall in the catchment areas. Investigations are also being made as to the silt contents of the water in several rivers.

TABLE OF CONTENTS

## REVIEW OF THE ADMINISTRATIVE ACCOUNTS OF THE BOMBAY PRESIDENCY, IRRIGATION BRANCH, FOR THE YEAR 1926-27, AS REQUIRED BY ARTICLE 328 OF THE ACCOUNT CODE (FIRST EDITION).

1. Cases in which a change of classification of Projects from Productive to Unproductive or vice versa is necessary:

The percentage of return on sum-at-charge for the last three years in the case of the following canals is as given below :-

Works classified as 'Productive' during the year 1926-27.

|  |  | $1924-25$ | $1925-26$ | $1926-27$ |
| :--- | :--- | ---: | ---: | ---: |
| 1. Kalri Canal.. | .. | 2.75 | 2.56 | . |
| 2. Mavinkop Tank .. | .. | 3.75 | 2.44 | 3.84 |

Works classified as 'Unproductive' during the year 1926-27.

The classification of the Kalri canal has been changed from Productive to Unproductive and that of the Baghar canal from Unproductive to Productive with effect from 1st April 1927 according to the orders contained in Government Memorandum No. 509-I.W., dated 25th June 1926. It is for Government to consider whether the orders contained in Government Memorandum Nos. 509-I.W., dated 25th June 1926 and 5th September 1925 regarding continuance of classification of Suttah Canal, Mavinkop Tank, Nira Left Bank Canal and Shetphal Tank and Ekruk Tank should not be revised in view of the percentage of return shown against each of them.
2. Cases in which an abnormal increase under working expenses is not accompanied by an adequate increase in the receipts.

The following canals come under this class. The working expenses and the receipts for the year 1926-27 as compared with those of the previous year are given below :-

|  |  | Working Expenses (Direct and Indirect) |  | Receipts(Direct and Indirect) |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | , | 1925-26 | 1926-27 | 1925-26 | 1926-27 |
|  |  | Rs. | Rs. | Rs. | Rs. |
| Sukkur Canal |  | 93,756 | 1,17,106 | 1,52,680 | 1,53,108 |
| Rajib, Chitti | and |  |  |  |  |
| Garang | . . | 19,175 | 26,796 | 79,809 | 78,720 |
| Marviwah |  | 7,165 | 17,089 | 16,233 | 17,856 |

vi

| Working Expenses <br> (iriect and Indirect) | Receipts <br> (Direct and <br> Indirect) |  |  |

## 1-A-contd.

STATEMENT I-A-contd.

STATEMENT I-A-concld.

(a) Owing to diversion of tail portion of Paikhed Canal the length of distributaries is diminished.
(b) These Gigures have been revised by the Executive Engineer, Nasik Irrigation Division.
(d)-These figures are for the whole project.
(e) Includes the Girna Left Bank Canal extension, as irrigation has begun on the extension since 1921-22.
(f) As actually completed.
(g) The culturable and irrigable areas commanded as given in the second revised project of the Pravara River Works are 182,976 and 57,000 actes respectively; these include old areas (culturable and irrizable at present) under Lakh Camal viz., 25,536 and 11,280 acres respectively, which are now incluJed in those of the Pravara Left Bank Canal, the Lakh Canal having since ceased to exist. As irrigation has begum on the extended Pravara Left Bank Canal figures shown in the statement are for the new Canal (including those for the Lakh Cansl). The figures for the old Pravara Left Bank Canal are not shown.
(h) These figures do not include the amount of widening the Nira Left Bank Canal.
( $k, 1,514$ is shown as calculated in the Nira Right Bank Canal Project, 1,435 is required with a duty of 500 acres per cusec.
(l) The Lakh Canal having ceased to exist since 15 th June 1925 the lengths of the main canal and distributaries thereof have now been included in the lengths of the branch canals and distributaries of the Prowara Left Bank Canal.
(m) Inclades proportionate expenditure on the new Lloyd Darr.

STATEMENT

Note.-The bold Gigures in brackets represent areas actua'ly irrigated during the respective seasons and the duties have duing the rabi season are assessed in Kharif papers and vice versa. In the rabi season in addition to pure rabi cropa the rabi areas.
Note by the Superintending Engineer, Central Circle:-
As perennial and eight months crops are irrigated during the rabi season, in order to obtain the figures of duty for the the rabi season are added to areas of rabi in column 4 and the total so obtained is divided by figures of rabi dischanges
(b) The difference between the discharges "At head" and "utilized" is due to canal water having been let into
(c) Low duties are due to scattered nature of innsation.
(d) The low daties are due to much extra absorption as the waterings allowed were mostly first or second waterings
(e) The duties on the Godavari and Pravara canals are low and divergent as the proportion of sugarcane and other

The low duties on the Pravara canals are due to the faet that irigation is yet under development, and partly due to
() Out of the area of 268 acres for rabi. 188 acres were irrigated from water left in tanks and 80 acres were given irrigation cannot therefore be calculated separately.
(g) The high duties on the Shetphal Tank are due to concentration of irrigation on a small channel.
(h) Figures of "utilized " discharge are not available as the quantity let into the Matoba tank could not be accurately Cantonment and also for industrial purposes.
(i) The low duties are due to high proportion of sugarcane and other perennials to the seasonal crops and also to
(i) There was no discharge from these tanks in the hot weather season. The average discharge and duties are therefore during the monsoon and rabi scasons there is no discharge from thrse tanks for days tozether due to rainfall and calculating average discharge and duties.
(b) This Tank reccived a very meagre replenishment just sufficient to issue one watering to a small area during the
*Area under consolidated assessment.
$\dagger \dagger$ This represents an area of 28 acres indirectly irrigated by underground percolation from the Mutha Left $\ddagger$ Oat of 49 cusecs left after giving 139 casecs to Kari cut and sluices from the total average discharge of 188 beca taken to be uilized.

## I-E-concld.

been calculated on these figures. They differ from those in statemeht IV-E owing to the fact that certain areas irrigated perennial and eight months crops are irrigated. To obtain correct duties therefore these crops have to be added to
rabi season in columns 15 and 17 the areas of perennial and eight months crops given in statement " G " irrigated in in columns 11 and 13. The figures in columns 15 and 17 thus represent aress actually irigated per cusec. Shetphal tenk and run to waste through scouring sluices.
and not for the full period of the season as these tanks received very small replenishment during the year. perennial crops to the sensonal crops is low and divergent.
large proportion of crops being sugarcane which is scattered over a large tract thus increasing the losses in canals. pre-seasonal waterings for rabi crops before 15th November along with Kharif watering of rice; the supply for rabi
,measured. A large quantity of water is besides supplied for drinking and domestic purposes to the Poona City and excessive percolation in the case of the Mutha cannals.
colculated on four months basis. If they were calculated on eight months it would give vitiated results. Even other causes. The actual number of days on which the channels were in flow has therefore been taken for puryoses of
monsoon. The tank did not receive replenishment during the rabi season. .
Bank Canal.
cusecs at head 40 cusecs are deducted on account of losses through all causes in the canal and thus 9 cusecs only have

## STATEMENT I-F.

Statement showing water-rates per acre in force during 1926-27 on Irrigation Works in the Bombay Presidency excluding Sind.

STATEMENT I-F--contd.

STATEMENT I-F-concld.

Note.- (1) For liftirrigation in the Deccan irrigation circle full fow rates are charged-vide G. R. No. 1947 of 20ith November 1923
(2) For lift irrigation half the ordinary rates are charged in other circles.
(3) Double the ordinary rates are charged as penal rates for taling water without permission.
(4) Leakage or percolation rates are the same as ordinary rates.
5) Water rates for non-irrigational purposes are charged at the rates sanctioned by Government in each case subject to the minimum rates fized in G. R. No. 851, dated the 7th April 1924.
(6) Water rate of Rs. 2 per acre per watering given to those who are not regular irrizators or holders of rabi leases-oide G. Rs. Nos A-1-1759 and A-1-2525, dated the 5th July 1906 and 3rd March 1916, respectively.

- (7) A reserve rate of $\mathrm{Ps}_{\mathrm{s}} 3$ per acre as a minimum rate has been sanctioned for lands let out for cultivation
( in the basin of Lake Eeale-dide G. R. No. 2484, dated 12th June 1927
- Lands wholly assessed at comsolidated rates.
$\ddagger$ For sugarcane and pan gardens double the seasonal rates are charged.
\& Fate calculated as per scale sanctioned in G. R. No. 8670, dated 13th January 1927.
* For one or more waterings to mature crops for which no applications for irrigation throughout the season are previously submitted.
A.-For sugarcane and pan gardens.
B.-For perennial crops other than sugarcane:
D.-For rice.

E--For monsoon crops other than rice.
(a) Rates sanctioned in G. O. No. A-i-1576, dated the 12th February 1918, were in force up to 14th February 1927-vide G. Rs. Nos. 3952, dated 26th November 1923, 29 th November 1924 and 20th $/$ pril 1926.
(b) Rates sanctioned in G. O. No. A-1-11465, dated the 28th August 1919, were in torce up to 14th Februery 1927-vide G. Rs. Nos. 3952, dated 26th November 1923, 29 th November 1924 and 20th April 1926.
(c) Rates sanctioned in G. Rs. Nos. A-1-1431 and 1964, dated the 28th June 1910 and 4th October 1911 respectively, were in force up to 14 th Februiry 1927-vide G. Rs. Ncs. 3952, dated 26th November 1923, 29th November 1924 and 20th April 1926.
(d) Rates for crops other than sugarcane and pan gardens are to remain in force up to 14th February 1932 and that for 1 保cane and pan gardens up to 14th February 1929-vide G. Rs. Nos. 3952, dated 20th April 1926, 23rd October 1926, 17th March 1927, and 13th July 1927.
(e) For the period from 15th February 1926 to 14th February 1928 the rates for sugarcane and pan gardens were double the seasonal rates and for other peremial crops the rates were single seasonal rates-vide G. Rs, quoted in (d) above.
(f) With effect from 15th February 1927 the following revised rates were initroduced and they will be in force up to 14th February 1932-vide G. R. No. 945!, dated 5th January 1927 :-

7. The Mhaswad Tank will be incorporated in the Nira Right Bank Canal system as soon as irrigation starts at the tail, when the rates sanctioned for the Nita Right Bank Canal will be enforced for all guaranteed irrigation on this tank.
$X$ For sugarcane and pan gardens double the sum of the seasonal rates for light type crops, for those seasons during which water is given, shall be charged, and for other perennial crops single seasonal rates for light type crops, when water is available.
(g) Rates sanctioned in G. R. No. A-I-5358, dated 30th March 1921, were in force up to 14th February 1927-vide G. Rs. Nos. 3952, dated 26th November 1923, 29 th November 1924 and 20th April 1926. Water was not to be reserved for perennial irrigation. If it was available in the hot weather season it was to be issued for sugarcane and pan gardens at double the hot weather rate and for other perennial crops at the hot weather rate.
(h) Rate sanctioned in G. Rs. Nos. A-1-2213, dated 15th October 1910 and A-1-17640, dated 18th November 1921, were in force up to 14ih February 1927-vide G. Rs. Nos. 3952, dated 26th November 1923, 29th November 1924 and 20 th April 1926.
(i) To be in forec up to 14th February 1929-vide G. R. No, 9906, dated 27th March 1928.
(i) From 15th June to 15th October.
(b) From 16 hh October to 14th June.
(i) From 15th February to 15 th June.
(m) From 15 th June to 15 th October or 15 th July to 30 th November.
(n) From 15th October to 15 th February.
(o) Sanctioned in G. Rs. Nos. 6573 , dated 8th January 1925 and 12 th March 1925
(s) In force up to 15 th February 1932-vide G. R. No. 334, dated 17th June 1926.
(u) Rates sanctioned in G. R. No. 6243, dated 3rd October 1924, were in force up to 14th February 1927. With effect from 15 th February 1927 the following rates were introduced and they will be in force up to 14 th February 1932-vide G, R. No. 6243, dated 7h February 1927 :-

| Crops |  |  |  | Rates. Rs. |
| :---: | :---: | :---: | :---: | :---: |
| Perennial, 12 months |  |  |  | $27 \frac{1}{2}$ |
| Perennial, 8 months, 15th June to $14 \ddot{\mathrm{~h}}$ February ${ }^{\text {a }}$ |  |  |  | 20 |
| Kharif | . | . | . | 4 |
| Rabi | . | $\cdots$ |  | 6 |
| Eight months | . | $\cdots$ |  | 0 |
| Hot weather | . | .. |  | 15 |
| Single watering | $\cdots$ | . | . | 12 |

(ip) Rates sanctioned for a period of five years ending 31st March 1930 in G. R. No.6095, dated 22nd October ( $x$ ) For sugarcane, betel leaves, elc., for 12 months.
(4) For eight months from 15 sh June to 15 h February.
(z) For eight months from 15 th October to 15 th June or 1 st Ausust to 31 st March.
a Rates sanctioned in G. Rs. Nos. 936 , dated 8th Cerober 1923, and 836, dated 23rd April 1924, and 836. dated 29 岁 July 1924, are to be in force up to 14 th February 1929.
a $^{2}$ Rates sanctioned in G. R. No. 156 A-1-1 112 , dated 12th July 1894, were in foree up to 14 h February 1928. With ef ect from 15th F ebrues 1928 revised rates were introduced-vide G. Rs. Nos. 4855, dated 5th March 1924 ard 23 rrd i ecember 1927.
$\mathbf{a}^{3}$ Rates sanctioned in G. Rs. Nos. 825, dated 30th Ausust 1924 and 825, dated lse November 1926, are to be in forceg up to 15th Jure 1930 .
a Rates sanctioned in G. Rs. Nos. A-I-1128, dated 13th May 1910 and 679/27, dated 25th November 1927, are to be in foree up to 3 190 July 1933.

Rates sanctioned in G. Rs. Nos. A-I-1335, dated 144h Juna 9910,815 , dated I8th February 1925 and 815 , dated 13 th November 1926, are to be in force up to 15 th June 1930 .
$a^{d}$ Rates sanctioned in G. Rs. Nos. A-1-309, dated 15it February 1911 and 5412, dated 15ih December 1926, are to be in force up to 15 th June 1930.
$1930^{-\mathbf{-}^{\circ}}$ Ratees sanctioned in G. O. No. A-1-9945, dated 12th October 1917, are to be in force up to 31st March 30- oide G. R. No. 6482 ,, datcd 19 ih December 1924.
$a_{0}^{7}$ For ordinary rabi.
${ }^{8}$ For restorative crops grown after rice.
9 In either kharif or rabi season.
$\mathrm{a}^{\text {IV }}$ Rates sanctioned in G. R. No. 1577, dated 20th April 1922, were in force up to 31at March 1927.
$0^{12}$ Rates sanctioned in G. R. No. 7736, dated 30th October 1925, in force from 15th June 1926 to 14 th February 1931.
$\mathbf{a}_{12}^{13}$ Rates in force for five years edding 15 t February 1930 -oide G. R. No. 6529, dated 17h January 1925.
${ }_{15}^{14}$ For sugarcane and pan gardens double the ordinary rates are charged.
$a^{18}$ In force for ten years ending 15th June 1930-vide G. O. No. A-1-16033, dated 8th December 1919.
$\mathrm{a}_{1}^{16}$ In force ill 31 st Merch 1931 - vide G . R. No. 8096. dated 4th J anuary 1926 .
 for late eight months crops during this period is Rs. 13 .
(b1) Rate for perennial 12 months.
(b2) Rate for perennial 8 months.
(b3) For sugarcane and perennial crops when supplied from the tank during the kharif or rabi seasons double tho ordinaty rates are charged and the rates are Rs. 4 per acre for the kharif season and Rs, 6 for the rabi eesoon.
