1906

Revenue Survey and Assessment.

Sind.

Revision settlement of the Hála Táluka, Hyderabad District.

No. 8761.

REVENUE DEPARTMENT.

Bombay Castle, 11th September 1906.

Memorandum from the Commissioner in Sind, No. 1143, dated 5th May 1906—Submitting, with his remarks, the papers specified in the margin containing proposals for the revision settlement of the Hála Táluka of the Hyderabad District.

Letter from the Assistant Collector, Hála, No. 621, dated 15th April 1905, with accompaniments.
Letter from the Superintending Engineer, Indus Left Bank Division, No. 2630, dated 10th June 1905.
Letter from the Assistant Collector, Hála, No. 1148, dated 18th July 1905.
Letter from the Collector of Hyderabad, No. 6464, dated 16th September 1905.

RESOLUTION.—The grouping and rates proposed by the Commissioner in Sind are sanctioned. The appended statement* shows the rates as sanctioned.

2. In view of the possible completion of the Rohri-Hyderabad Canal, the Governor in Council is of opinion that the period of guarantee should not exceed ten years, and is accordingly pleased to direct that the settlement should be introduced from 1st August 1906 and guaranteed for a period of ten years, subject to the usual reservation.

3. In giving out fresh land in the táluka during the period of the new settlement the Collector should bear in mind the possibility of the construction of the canal.

4. The petitions of objections do not disclose any grounds to lead Government to modify the orders passed above.

5. The Governor in Council is pleased to endorse the commendation bestowed by the Commissioner on Mr. Moysey for the manner in which he has prepared this report.

G. MONTEATH,
Under Secretary to Government.

No. 1143 of 1906.

REVENUE DEPARTMENT.

Commissioner's office,
Karachi, 5th May 1906.

MEMORANDUM.

With reference to Government Resolution No. 6341, dated the 18th August 1904, the Commissioner in Sind has the honour to submit the papers marginally noted, containing proposals for the revision of rates in the Hala taluka of the Hyderabad district.

(1) Letter No. 621, dated the 15th April 1905, from the Assistant Collector, Hala, with accompaniments.
(2) Letter No. 6464, dated the 16th September 1905, from the Collector of Hyderabad.
(3) Letter No. 2620, dated the 10th June 1905, from the Superintending Engineer, Indus Left Bank Division, to the address of the Collector of Hyderabad.
(4) Letter No. 1148, dated the 13th July 1905, from the Assistant Collector, Hala, to the address of the Collector of Hyderabad.

2. Mr. Moysey's report is carefully prepared and well written, and shows that he thoroughly knows the taluka.

3. The Commissioner accepts the proposed grouping *in toto*. Mr. Moysey has given full and sufficient reasons for the changes proposed, and the Collector is in thorough agreement with him.

4. As regards the rates, the improvement in communications due to the Kotri-Rohri railway and the unmistakable rise in prices are factors which might have justified a larger increment in revenue than the 1·40 per cent. resulting from Mr. Moysey's proposals. No appreciable increase of revenue can, however, be obtained, unless the lift rate is enhanced, as Hala is mainly a lift taluka; and in view of the circumstances stated by Mr. Moysey at page 31 of his report and of the principles laid down by the Government of India in their letter No. 1487-I, dated the 3rd November 1905, embodied in Government Resolution No. A. I.-87, dated the 16th January 1906, regarding the assessment of lift and flow rates, the Commissioner does not think that any increase under this head is advisable. He therefore accepts Mr. Moysey's proposal, which is concurred in by the Collector, to allow the present lift rates to continue.

5. The Commissioner is unable to agree with Mr. Mules that the garden and rice rates must necessarily be the same. His proposals (*vide* the table attached to his letter, page 125 of the papers) would have the effect of adding 12 annas to the rice rate in each group. This the Commissioner considers too much, and recommends an increase of 4 annas only.

6. The Commissioner is also unable to agree with Mr. Mules in his proposal to allow the "other flow" rate to stand at its present figure. The difference of 4 annas in each group between the present "lift" and "other flow" rates is inadequate, and, in view of the Government of India's orders quoted above, the Commissioner would recommend that the increases proposed by Mr. Moysey should stand.

7. As regards the increases proposed in the rates for "sailabi" and "sailabi aided by lift," Mr. Mules' assurance that no hardship will be caused by the proposed enhancement may, the Commissioner thinks, be accepted and the increases sanctioned.

8. With reference to Mr. Mules' remark in paragraph 15 as to the "bosi" rate, the Commissioner would recommend an increase of 4 annas in each group

for this class of irrigation also. The revised rate will still remain the lowest rabi rate in the taluka. In several talukas, "bosi" pays as much as "sailabi." The rate for "bosi aided by lift" should also be increased by 4 annas in each group.

9. No increase is proposed by the Settlement Officer in the dubari rate. The general opinion (including that of Mr. Baker, whose experience and judgment in these matters are unexceptionable) is that the rate charged on dubari is quite incommensurate with the advantage derived from it by the cultivator. In a dry taluka like Hala, the Commissioner would let the rate for unwatered dubari stand at 4 annas, but he thinks watered dubari should certainly be assessed at a higher rate. There are no perennial canals in the taluka, but still Government are entitled to some return for the water running in their canals and used by the cultivators in the rabi season. He would accordingly recommend that the rate for watered dubari should be raised to 8 annas an acre.

10. The Commissioner agrees with Mr. Mules' remarks about the *kachá* rates, and considers that no change in them is required.

11. As regards the guarantee, the Commissioner is inclined to think that 10 years is, as a rule, too short a period for a settlement, even in Sind. No important changes are likely to take place in the conditions of the Hala taluka, unless and until the Rohri feeder completely revolutionises the district. But, in all probability, it will be a long time before that scheme takes practical shape, and the Commissioner therefore is in accord with Mr. Moysey's original intention, and recommends a guarantee for 20 years. The usual reservation declaring the right of Government to increase existing rates or charge an extra water cess in the event of any marked irrigational improvements being carried out will be sufficient to safeguard the interests of Government.

12. The two petitions of objections referred to in paragraph 17 of Mr. Mules' letter are herewith forwarded. The one in Sindhi is dealt with in Mr. Moysey's letter at page 124 of the printed papers, and the other in paragraph 15 of Mr. Mules' letter. The Commissioner agrees with the Collector that no case is made out for any modification of the Settlement Officer's proposals as regards the dehs concerned.

13. A statement showing the rates now proposed by the Commissioner is appended.

A. D. YOUNGHUSBAND,
Commissioner in Sind.

Commissioner in Sind.

HALA SETTLEMENT REPORT, 1905.

INDEX.

No. 621 of 1905.

Assistant Collector's office,

Camp Tando Alahyar, 15th April 1905.

From

THE ASSISTANT COLLECTOR,
HALA,

To

THE COMMISSIONER IN SIND.

Sir,

I have the honour to submit the following proposals for the re-settlement of the Hala taluka, the current settlement of which was guaranteed for a period of 10 years from the 1st August 1894 by Government Resolution No. 3776, dated the 18th May 1895, and extended to the 31st July 1906 by Government Resolution No. 7841, dated the 10th November 1903.

2. The taluka is a long, narrow, flat strip of land, of a total length of 44 miles, an average breadth of about 12 miles, and an area of 510·89 square miles, bounded on the north by the Sakrand taluka, on the east by the Shahdadpur and Tando Alahyar talukas, on the south by the Hyderabad taluka, and on the west by the Indus. It has an area of 326,968 acres 38 guntas, deh Giss, measuring 4,846 acres 12 guntas, having been transferred to it from the Shahdadpur taluka in 1903-1904, and is divided into 17 tapas, which are subdivided into 118 dehs, of which 8 are wholly jagir and 10 are wholly Government forest, and do not therefore concern this settlement.

The most important physical feature of the taluka is the comparatively high elevation of the land, owing to which 79 per cent. of the cultivation is lift, the small amount of flow and lift aided by flow cultivation that exists being almost all in the north. The low-lying river lands in the west are now mostly occupied by Government forests, but strips of rayati land still remain there, which are flooded from the river in the inundation and cultivated in rabi. The soil is all alluvial. In places in the north where the level of the land is comparatively low, and especially wherever there is flow cultivation, it is hard and firm, while in the higher south it is loose and friable. There is remarkably little *kalar* or salt land. A belt of sand-hills runs roughly along the course of the railway in the south-east, giving to passengers a dreary outlook on the taluka, and scattered sand-hills exist in other parts, notably near Khebar and Bhit Shah. Outside the Government forests, which line the river bank, there is little jungle or natural pasture for any animal except the goat.

3. *Population.*—Details are given in appendices V and VI. Unfortunately, the taluka office did not preserve out of the records of the census of 1901 the numbers of Hindus, Muhammadans, and others, or of males under and over 15 and females under and over 12, or of literate persons. The numbers of Hindus, Muhammadans, and others, and the percentage of literate persons in the whole taluka, excluding deh Giss, have been extracted from part III of the Bombay Census Report, but there are no details, except the total numbers of males and females, available separately for deh Giss, which was transferred from the Shahdadpur taluka in 1903-1904, and the division of the population of that deh by religions and the estimated percentage of literate persons have been arrived at by the proportions prevailing in the rest of the taluka. The division of the total population of the taluka by ages, on which no information could be got from the Census Office, Poona, is more or less guess work. The totals of males and females have been verified and corrected by the Bombay Census Report, and may be relied on. Excluding the population

of deh Giss, there has been an increase in the taluka of 3,474 males and 3,389 females between 1891 and 1901 and the pressure of the population (excluding deh Giss) is 192 per square mile as against 181 in 1891. Including that of deh Giss, it is now 193. No emigration or immigration to speak of has occurred, unless the annual influx and departure of Marwaris, Tharis, and Kachis in search of work can be dignified by these names.

The statistics of the occupation of the people have been drawn from the form which is said to have been maintained in the taluka office since the last census, but I cannot for a moment believe they are correct. The number of persons, for example, shown as dependent on agriculture alone is far too small. Correct details could not be procured either from the Bombay Census Report, in which table XV has not been prepared, or from the Census Office, Poona.

4. *Agricultural stock.*—Statistics are given in appendix X. The figures are not very reliable, as they are not ascertained by any census, but by rough estimates which the tapadars obtain from the chief men of each village. The taluka is generally free from cattle disease, and no serious loss seems to have been caused by any during the current settlement.

5. *Communications.*—The construction of the Kotri-Rohri Railway (opened on the 16th November 1896) and of the bridge over the Indus between Gidu Bandar and Kotri (opened on the 15th May 1900) has effected an important change in the communications of the taluka, which has now been given direct connection with Karachi. The course of the railway through the taluka itself is confined to the south-east corner, but it continues thereafter at a moderate distance along its eastern boundary. The stations in the taluka are 2—Alahdino Sand and Udero Lal; but its trade is also served by those of Khatian Road in the south, Tando Adam and Shahdadpur in the east, and Lundo and Sarhari in the north-east, on the North-Western Railway, and by those of Khesano Landhi, in the extreme south-east, and Tando Jam, in the south, on the Jodhpur-Bikanir Railway, which, in October 1901, took over and converted into a narrow guage the former broad guage branch of the North-Western Railway to Shadipali, a line opened in 1892 before the current settlement. On the west of the taluka and the right bank of the river is the Indus Valley line, which was in existence before the first introduction of an irrigational settlement into Hala in 1884. Only one station on this line as far as Kotri is used by the trade of the taluka, *viz.*, Manjhand, to which boats cross over from the Khari Nakur ferry.

The nature of this change may best be shown by an account of the former course and outlets of trade. In 1884, according to paragraph 6 of Colonel Anderson's settlement report, agricultural produce from the taluka used to go almost entirely to Hyderabad by boat or road, and the Indus Valley Railway was little used except by passengers. I doubt if this statement was quite correct. Hyderabad must have been merely a forwarding centre to Karachi, as it has never had any industries to speak of, except cotton ginning, and millets, the only food-grains produced and exported to any extent from Hala, are grown in the neighbourhood of Hyderabad in quantities quite sufficient for local consumption. In 1884, then, when Manjhand and Kotri were connected with Karachi by the Indus Valley line, a considerable amount of grain from Hala must have been sent direct to Karachi by these stations, as at present.

In 1894, according to paragraph 11 of Mr. Seymour's settlement report, agricultural produce from a few dehs in the south used to be sent direct to Hyderabad by road, but from the rest of the taluka it was exported from one of the three ferries at Khari Nakur, Ghotana, and Jakhreja on the river in the west of the taluka to Manjhand or Kotri, whence it went to Karachi, or to Gidu Bandar and thence to Hyderabad. The Hyderabad-Shadipali line was opened on the 18th August 1892, but Mr. Seymour does not say whether the Landhi and Tando Jam stations, which were in existence from that day, were of any use to the taluka.

The opening of the Kotri-Rohri Railway has now diverted most of the exports that used to go by the ferries on the west to the stations on the east.

The Jakhreja ferry, which is nearest to, and therefore most affected by, the railway, is almost disused, and the Ghotana and Khari Nakur ferries have lost the whole of the trade of the Shahdadpur taluka and much of that of Hala and Sakrand. (The river route is even now in many cases where the railway is preferred the directer and cheaper course, but it is slower and more dangerous, and the boatmen are apt to pilfer. The superiority of the railway in the trader's eyes lies in its speed, certainty and security, for which he is willing to pay a greater price.) The only agricultural exports of importance from the taluka are bajri, cotton and cotton seed. Cotton seed is consumed locally in considerable quantities for cattle food and is exported from the factories over most of Sind. The first two exports are now, with the exception of a little uncleaned cotton which is brought by the factory owners of Hyderabad from the southernmost dehs, and a certain amount of grain which may be imported from Hala for consumption in the neighbouring towns and villages just outside the taluka, sent direct to Karachi. Thence, the cotton goes to Europe and the bajri to Cutch. Thus, the transit trade that Hyderabad used to enjoy from this taluka has now been stopped, and the dehs nearest to it are too far away from the town and too near other stations to make it worth while to import grain from them for consumption in Hyderabad itself. In their small exports of cotton to Hyderabad, these dehs enjoy no greater advantages than the others that send their cotton to the numerous factories in and near the taluka. Hyderabad is now of practically no importance to the Hala taluka. By giving through connection to Karachi, the Kotri-Rohri Railway has largely equalised the differences that existed at the commencement of the current settlement between the northern dehs and the southern, and its stations have given the east of the taluka the same advantages that were formerly monopolised by the west, so that all the dehs are now within easy distance of a station or a ferry.

The following table gives the cost per maund of sending grain, cotton seed, and cleaned cotton to Karachi from the various centres of export. Cotton is not despatched to Karachi from the stations of Sarhari, Lundo, Khatian Road and Khesano Landhi, and the only ferry that now exports cleaned cotton is Ghotana, whence it is sent by boat to Kotri and thence to Karachi by rail. I have omitted the cost of loading at the stations and ferries themselves, as I received such different estimates from traders that I am afraid there has been some hard lying, and the cost must be much the same everywhere. Similarly, I am unable to state, with certainty, the rates of boat carriage, as every one I questioned—whether trader, zamindar or boatman—feared it was proposed to increase his particular tax and spoke accordingly. Those I give I obtained from men whom I questioned casually and unawares, and I believe they are correct:—

Station or ferry.	Carriage per maund to Karachi city.		Station or ferry.	Carriage per maund to Karachi city.	
	Grain and cotton seed.	Cleaned cotton at owner's risk.		Grain and cotton seed.	Cleaned cotton at owner's risk.
	Rs. a. p.	Rs. a. p.		Rs. a. p.	Rs. a. p.
Sarhari ...	0 3 3	...	Alahdino Sand.	0 2 8	0 7 5
Lundo ...	0 3 3	...	Khatian Road..	0 2 8	...
Shahdadpur...	0 3 2	0 9 2	Khesano Landhi.	0 2 9	...
Tando Adam..	0 2 11	0 8 6	Tando Jam ...	0 2 8	0 7 1
Udero Lal ...	0 2 11	0 7 11	Khari Nakur...	0 3 8⅔	...
			Ghotana ...	0 3 7	0 7 9¼
			Jakhreja ...	0 3 6	...

The cost of carriage to Karachi from the ferries is made up as follows :—

Khari Nakur (grain only).				Jakhreja (grain only).				Ghotana.						
								Grain and cotton seed				Cleaned cotton.		
	Rs.	a.	p.		Rs.	a.	p.		Rs.	a.	p.	Rs.	a.	p.
Carriage by boat to Manjhand bandar.	0	0	2⅔	Carriage by boat to Kotri bandar ...	0	0	6	Carriage by boat to Kotri bandar ...	0	0	7	0	0	10⅘
Carriage by camel to Manjhand station .	0	0	4⅘	Carriage to and loading at Kotri station ...	0	0	6	Carriage to and loading at station.	0	0	6	0	0	6
Loading at station ...	0	0	1⅕	Carriage by rail to Karachi ...	0	2	6	Carriage by rail to Karachi ...	0	2	6	0	6	5
Carriage by rail to Karachi	0	3	0	.....				.....						
	0	3	8⅔		0	3	6		0	3	7	0	7	9⅘

The competition of the Kotri-Rohri Railway appears to have lowered the rates of carriage at the Jakhreja and Ghotana ferries. In 1894, according to Mr. Seymour, the rate from Ghotana to Kotri was 1 anna 9 pies per maund for cotton and 1 anna per maund for grain. Mr. Seymour does not state whether these rates include the cost of loading at Ghotana (which is, I was told by both traders and boatmen, 6 pies a maund, though this seems an excessive figure), but, assuming that they do not, it appears that the rate for cotton has been lowered by 10⅕th pies and that for grain by 5 pies. From Jakhreja, when Mr. Seymour wrote his report, the rate of carriage to Kotri is stated to have been for cotton 1 anna 9 pies and for grain a little over 4 pies a maund. I suspect that there was some mistake in these rates, since the charge for cotton is the same as, while the charge for grain is ¼th of, that from Ghotana to Kotri. No cotton is now conveyed from Jakhreja to Kotri The boatmen say that they are prepared to carry grain to Kotri for 6 pies a maund, but that they get no custom.

The rate of carriage for grain in 1894 from the Nakur ferry to the Manjhand station was, according to Mr. Seymour, 5 pies a maund, a sum which is apparently meant to represent the total cost between these two points. Here, again, I suspect an error. The present rates per maund, which are certainly moderate and are unlikely to have risen, are—loading at the ferry ⅓ pie, conveyance by boat to Manjhand bandar (10 miles) 2⅔rds pies, and carriage by camel to station (1½ miles) 4⅘ths pies—total, a trifle less than 8 pies a maund. On the other hand, the Kotri-Rohri line is further off from, and probably has not had so much effect on, the traffic between Nakur and Manjhand as on that between Ghotana or Jakhreja and Kotri. No grain is now sent by boat from Nakur to Kotri, as is said by Mr. Seymour to have been done in 1894.

Only one ginning factory—that at Ghotana itself—now sends its cotton by boat from Ghotana to Kotri. Even the Khandu factory, only 2 miles away, has taken in the last two years to sending its out-turn to the Udero Lal station and thence by rail direct to Karachi, though the nominal expenses of this route are more by 1 anna 6⅓rd pies a maund than those of the rival route first by river to Kotri and then by rail to Karachi. Grain for Kotri is now the chief agricultural export from Ghotana, and the boatmen also convey down the river large quantities of fuel from the Government forests. From Kotri, the boats sometimes return with cargoes of dates, cocoanuts, salt, sugar and spices from Karachi for New Hala. Boats from the Larkana district bring to Ghotana rice, wheat, pulses, gram and juari, and return with cotton seed. Occasional boats from Ghotana carry to Belo (in the Sujawal taluka) and Keti Bandar Hala pottery and tobacco, and return with molasses.

Only grain is exported from the Khari Nakur ferry, the cotton grown in the neighbourhood all going to the ginning factories in the east and thence, after cleaning, to Karachi by the Kotri-Rohri line. Cloth, dates, cocoanuts, sugar, salt, and spices from Karachi, and rice and molasses from Larkana, come to the Sann station, north of Manjhand, and are ferried across down-stream to Nakur.

Fuel from the riverain forests is now almost the sole commodity sent by boat from the Jakhreja ferry to Kotri and elsewhere. Small quantities of bajri, tobacco, jambho oil, and onions are, however, sent by boat down the Indus to the Shahbandar and Ghorabari talukas (localities out of the reach of the railway), whence a little red rice is imported in return.

The internal communications of the taluka are (*a*) by road and (*b*) by navigable canals.

(*a*) It is provided with numerous and sufficient kacha Local Funds roads, composed for the most part of such a loose and friable material that they are in a chronic state of ruts and dust. None are metalled, as the absence of stone quarries in or near the taluka makes the cost prohibitive, and *kalar* earth, the best material for kacha roads, is rare. They are bridged as well as the slender income of the Taluka Local Board permits, but bridges are still urgently needed in several places. The high road from Hyderabad to Rohri runs through the taluka from south to north by Matiari, Hala and Saidabad, and branches or paths issue from it to all the important villages and centres and outlets of trade.

The camel is practically the sole means of transport. Here and there, a stray cart may be seen, and vegetables and fuel in small quantities are carried to market on ponies and donkeys. The rates of camel hire vary greatly according to the season of the year. They are lowest in the cold weather, even though the demand is then greatest, because both men and camels are disengaged from working the water wheels, and the latter are much more vigorous than in the hot weather. In that season, they rise to a third or half as much again or even twice as much as what they were in the cold weather. The rates for carriage of cotton differ from those for grain or cotton seed, inasmuch as cotton is more bulky and unwieldy, and if a camel can carry 8 maunds of grain or cotton seed (the ordinary load over a long distance), he will only carry seven of cotton. During the last cold weather, the charge for the conveyance of cotton, as ascertained from numerous instances, varied from $1\frac{1}{2}$ pies per maund per mile over a long distance, such as 28 miles, to 4 pies per maund per mile over a short distance, such as $1\frac{1}{2}$ miles. The carriage of grain and cotton seed may be put as one-eighth cheaper.

Turning to the rates prevailing at the commencement of the current settlement, I find that Mr. Seymour in paragraph 11 of his report gives the (presumably cold weather) rate of carriage by camel to the Ghotana ferry of both cotton and grain as varying from 1 anna 9 pies a maund over a distance of 12 miles (*i.e.*, $1\frac{3}{4}$ pies a maund a mile) to 6 pies a maund over a distance of 1 mile; of grain to the Nakur ferry as varying from 2 annas a maund over 12 miles (*i.e.*, 2 pies a maund a mile) to $2\frac{1}{2}$ pies a maund over a distance of 1 mile; and of cotton and grain to the Jakhreja ferry as varying from $1\frac{1}{2}$ to 2 pies a maund a mile (the distance not being stated).

There are some remarkable differences in these rates (due, perhaps, to custom or special arrangement), of which the chief is that between the rate of 6 pies per maund over a distance of 1 mile to the Ghotana ferry and that of $2\frac{1}{2}$ pies per maund over the same distance to the Nakur ferry. But it is clear, I think, that the rates of camel hire are not lower now than in 1894, and that the advent of the railway has made no material difference to them. This is natural, as the railway only passes through a small portion of the taluka in the south-east, thereafter skirting its eastern frontier, and consequently does not enter into competition with camels within the taluka, except in a limited area. Moreover, cleaned cotton and surplus grain and cotton seed are exported to Karachi, and are not therefore carried by camel along the line of the railway, but to the nearest railway station, if they do not go by boat to Kotri. It is, however, somewhat surprising to learn, as I have done from the Station Masters of Udero Lal, Alahdino Sand and Lundo, that the railway secures very little, if any, of the traffic in uncleaned cotton to ginning factories along its line. Messrs. Ralli Brothers at Tando Adam, to whom I am indebted for much information as to rates, write that it pays them better to import their cotton from the neighbourhoods of Shahdadpur, Alahdino Sand, Udero Lal and Tando Alahyar by camel than by rail.

(*b*) There are 5 main lines of navigable canals in the taluka, *viz.*, the Sarfraz, the Nasir, the Gharo Mahmudo with its branches the Ghalu and the Sangro, the Great Marakh, and the Gharo Rano with its branches the Gharo Gahot and the Awat. All of these are inundation canals, and are therefore not available till well into the hot weather, when the zamindars have generally disposed of their produce. Fuel from the Government forests on the river banks and imports from other talukas such as rice, molasses, jambho, peas, sugar, spices, dates and cocoanuts are the chief commodities that the boats on them carry. Bajri is, however, conveyed on the Sangro wah, *viâ* the Gharo Mahmudo, from Ghotana to Tando Adam (15 miles) at a rate varying from 4 to 6 pies per maund, and bajri and occasionally wheat and onions are conveyed on the Marakh Wado from Khari Nakur to Shahdadpur (24 miles) at 6 pies per maund, and occasionally as far as Landhi (30 miles) at 7 pies a maund. Before the opening of the Shadipali and Kotri-Rohri Railway lines, wheat, mung, til and bajri used to be imported into the taluka from the Nara Valley by boats on the Sangro wah, but this traffic now seems to have ceased.

The only rate of boat carriage on canals given by Mr. Seymour in his report of 1894 is that of 5 pies per maund per mile on the Great Marakh wah to Nakur, but the Collector of Hyderabad in commenting on this rate showed it to be excessive and certainly a mistake. The railway does not compete with boat carriage within the taluka, and has probably therefore had no effect on the rates.

6. *Markets.*—Almost all the zamindars, with the exception of a few wealthy and intelligent Amils, dispose of their produce, other than fruit or vegetables, at the threshing floor, where the purchaser has to take delivery and make his own arrangements for conveyance. The trade in agricultural produce is mostly in the hands of small middlemen. All the larger villages have local banias who buy grain and cotton and dispose of it to larger men in, say, Tando Adam or Ghotana, who, whenever there is any demand, buy from all over the taluka. Even the factory owners do not usually buy cotton direct from the agriculturist, but from a local trader. There are no markets for grain and cotton in the sense of places to which cultivators bring their produce for disposal. No doubt, if a man took his cotton to a factory, he would find a ready sale; but this is not done. The immediate markets for uncleaned cotton are the ginning factories at Ajan Shah, Ghotana, Khandu and Matiari in the taluka itself, and, beyond, in Sahib-jo-Goth (in the Shahdadpur taluka), Shahdadpur, Tando Adam, Tando Alahyar, Tando Jam and Hyderabad. These factories, except the distant ones at Tando Alahyar, Tando Jam and Hyderabad, by no means confine their purchases to the dehs in Hala nearest to them, but buy from all over the taluka, especially when there is any demand or when they are under agreement to deliver a certain amount of cotton within a fixed time. The ultimate destination of all cotton is Europe *viâ* Karachi. Cotton seed is consumed locally for cattle food and is exported to Karachi, Hyderabad, Sukkur, Larkana and other parts of Sind. Much of the bajri and juari produced is locally consumed, but it is impossible to say in what proportion of the whole. For local consumption, these grains are bought by traders in villages dotted all over the taluka. There is naturally a considerable demand in the large towns of Hala, Matiari and Tando Adam, but their importance as markets is discounted by the octroi duty their municipalities levy on grain. The ultimate destination in Sind of almost all millets exported from the taluka, other than those sent to villages and towns just outside its borders, is Karachi, whence they are sent to Cutch. Til seed is exported raw to Karachi and thence to Europe. Wheat is also sent to Karachi for consumption or export. Tobacco is locally consumed, and also sent to Hyderabad and southern Sind. Jambho is all consumed locally in the manufacture of oil and oil-cake (*vide* paragraph 7). The centres of export are the railway stations and ferries noted in paragraph 5. There are no means of telling what the agricultural exports from the taluka really amount to. The returns from the railway stations would be misleading, as they all include exports from other talukas as well, and there are no statistics available for the ferries.

Vegetables and fruits are, unlike other agricultural produce, generally

carried to market by their growers. The cultivation of, and trade in, vegetables is practically in the hands of Hindus, Mahomedans generally, with the exception of a few Memons, having neither sufficient energy nor enterprise for the work. Vegetables are chiefly grown in the neighbourhoods of New and Old Hala, Khandu, Sekhat and Matiari, whence the bulk of them is sent to New Hala, Matiari and Tando Adam, in the vegetable markets of which towns busy scenes may be witnessed any day up to noon. Thence they are bought by banias, who come on ponies from outlying villages, and distribute them over the Shahdadpur and Hala talukas and part of Tando Alahyar within 24 hours of their picking. Straw is also brought for sale in the vegetable markets of these large towns.

7. *Manufactures and industries.*—Cotton ginning is the chief industry in the taluka that affects its agricultural prosperity. There are now only 4 steam ginning factories at work in it—at Matiari, Khandu, Ghotana, and Ajan Shah—as against the 9 that were working in 1894, according to Mr. Seymour's report, *i.e.*, 3 each at Khandu and Ghotana, and 1 each at Matiari, Salaro and Ajan Shah. The trade is a speculative, and apparently, in view of the number of its failures in this taluka, a risky one. There used to be 4 factories at Ghotana, of which two were closed and the machinery sold in 1897, one—opened in 1897—was removed to Shahdadpur in 1903, and one—opened in 1892—is still working. There were also at one time 4 in Khandu, of which 2 were closed and the machinery sold in 1896 and 1897, one has been closed (perhaps, temporarily) this year on account of the losses of the firm, and one—opened in 1891—is still working. The factory at Salaro was closed and the machinery sold in 1896. Those at Matiari and Ajan Shah have been in existence during the current settlement. Another was opened at Sekhat in 1897 and was closed from 1899 to 1902, when it was opened for one year and then closed again. In all but two cases, the failure of these factories occurred too early to be attributable to the opening and competition of new factories at Tando Adam and Shahdadpur on the advent of the Kotri-Rohri Railway, and it is probable that there were too many of them for the trade. It is unlikely that any new factories will hereafter be opened in the taluka except, perhaps, at the stations of Alahdino Sand and Udero Lal. The labourers employed are immigrant Tharis, Marwaris and Kachis, and never, as far as I have seen, Sindhis, who are too well off or too lazy for the work.

Cotton is now cleaned in hand gins for the sake of seed alone, for which superior bolls of cotton are selected, but not with any great care. The sole centre of this trade is Bhit Shah, where banias keep establishments of a dozen gins or so. These are on much the same principle as steam gins, but do not crush or nip the seed like the latter. This injury seems to be the reason why steam-ginned seed is far less productive than hand ginned. It is sometimes said that it is the heat of the steam gins that injures the germinating power of the seed, but seeds caught as they fall from the rollers into the gallery below are only slightly warm, whereas a handful taken at random shows that many have been cut and broken. The Bhit Shah hand-ginned seed has a wide reputation, and the demand for it leads to inferior bolls being ginned and even, it is said, to adulteration with seed from factories.

There are 182 machines in the taluka of the usual primitive pattern for pressing oil from jambho, rape, and (a very little) sesamum seed. 70 of these are at Matiari, 30 at New Hala, 20 at Old Hala and 17 at Khebar. The taluka does not itself grow more than 15 per cent. of the jambho and rapeseed used in these machines, the remainder being imported from the Nara Valley and the Lar. During the operation of pressing jambho, chopped bajri or juari straw is inserted in the machine and, mixing with the crushed seed, forms a cake, which is a valuable cattle food. Sariah gives a very inferior cake, which is used to adulterate that of jambho.

A little coarse thread is still spun by women in New Hala and some other places in the taluka, but the industry is very small, and weavers get their thread for most kinds of cloth from abroad. A coarse, strong, brown cloth,

called *khadi*, of which alone in former times the dress of the lower classes used to be made, is woven from this home-spun thread.

The weaving industry seems to be still fairly flourishing in the towns of New Hala and Matiari, in the former of which there are said to be 500 weavers. Trouser cloths, coverlets, coloured trouser strings, and cotton, but not silken, lungis are woven in New Hala, but the town is celebrated for its trouser cloths alone.

New Hala, Matiari and other towns also possess a small dyeing industry. There are said to be 20 dyers in New Hala. They generally use cheap and unlasting aniline dyes, and stamp the cloth with uninteresting patterns.

New Hala is celebrated for its glazed pottery, which is well known and has been described at length by Mr. Seymour. The only other artistic industry of merit is the skilful turnery and lacquer work of Khanot, of which inferior imitations are found in New Hala, Rahu, Khandu and some other places.

8. *Climate.*—The climate of the taluka is dry and for Sindhis healthy. Owing to the high level of the land and the consequent absence of floods and swamps, there is comparatively little fever throughout the year.

The climate is well suited to the crops grown in the taluka, but cotton and early wheat and oil-seeds are exposed to the risk of frost in December and January. Almost every year, cotton is said to be more or less damaged by frost, and late in the December of 1903 a sharp frost killed off the unripe cotton all over the taluka and lowered a 16-annas to an 8-annas crop. Cotton grown in the damper air on the low-lying lands among and at the edge of the riverain forests flourishes luxuriantly in leaf and stem, but gives much fewer bolls than that further inland. For this reason, it is rarely grown in these situations. Winter crops of wheat and oil-seeds grow very well in the limited area of flooded land by the river where there are no heavy mists, as in Lower Sind, to damage the wheat.

The rainfall as registered at Hala during the past 10 years, and at Matiari during the past 4 years (before which no rain gauge was kept in that town), is given in appendix IV. The average annual rainfall at Hala has only been 6 inches 22 cents. and that at Matiari 5 inches 86 cents. July and August are the two rainiest months in the year. August heads the list of the Hala rain gauge with an average rainfall of 2 inches 20 cents., its average at Matiari being 1 inch 28 cents.; and July heads that of the Matiari rain gauge with an average of 2 inches 7 cents., its average at Hala being 1 inch 50 cents. In no other month does the average rainfall reach 1 inch.

9. *Irrigation.*—Copies of letters No. 7089, dated the 19th November 1904, and No. 7425, dated the 3rd December 1904, from the Executive Engineer, Central Hyderabad Canals, on the irrigation of the taluka are attached, together with a statement showing the annual expenditure during the decennial period 1894-1895 to 1903-1904 on the clearance of each canal in the taluka, which, Mr. Agashe has explained in a later letter (No. 7886, dated the 25th December 1904), includes the total cost of clearing the canals throughout their length in the Shahdadpur, Tando Alahyar, and (in the case of the Sarfraz) the Dero Mohbat talukas as well as that of Hala. It is, therefore, impossible to say precisely what is spent on clearance in the Hala taluka alone. The average annual amount spent on the canals shown in the statement has been Rs. 27,461, and the clearance done is generally speaking satisfactory. A copy of Mr. Agashe's No. 7815, dated the 23rd December 1904, dealing with the bands in the taluka is attached. Only one, the Ghalu Ali Bahar, exists, and that is small and unimportant.

The Executive Engineer's reports on the canals, all of which are inunda-

tion, may be summarised as follows :—

Canal.	Working during the current settlement.	Improvements or alterations during the current settlement.	Further proposed improvements or alterations.
Ali Bahar Kacheri.	Apparently unsatisfactory until the last abkalani season, since when the erosion of the Great Marakh Dhand has given it a direct supply from the river in addition to a supply from the Nakur Dhand, which is fed from the Indus by the Gharo Ali Bahar Kacheri.	A cut from the Great Marakh Dhand made in 1899-1900 at the cost of Rs. 480 to give it an early supply.	*Nil.*
Great Marakh Wah.	Most satisfactory ...	It used to be supplied from a dhand, which in 1900 got silted at both ends and to which a cut had to be made from the river at a cost of about Rs. 1,800 to give it an early supply. The dhand has now been eroded, and the canal has a direct supply from the river.	*Nil.*
Gharo Rano.	Good, but its head was silted up by erosion in 1903 and it ceased flowing early.	A new mouth was given it in (apparently) the winter of 1903, which worked well in the abkalani of 1904.	*Nil.*
Gharo Bhanot.	Satisfactory	*Nil.*	*Nil.*
Gharo Mahmudo.	Was silted badly in 1898 on account of erosion to its head. Now satisfactory.	A new mouth, 1¼ miles long and 20 feet broad, from a dhand fed by the Indus, was given in 1899 at a cost of Rs. 6,532. This was widened to 40 feet in 1903 at a cost of about Rs. 4,000.	To canalise this Gharo and improve the supply in it and the Ghalu wah, a project, amounting to Rs. 2,55,000, has been sent to the Superintending Engineer, Indus Left Bank.
Ghalu ...	Good	A direct supply channel from the river made by the zamindars in 1893 was widened by the P. W. Department in 1895 from the clearance grant, so that the cost is unknown.	.....
Nasir ...	Good	*Nil.*	Strengthening the left bank with a view to preventing the flooding of the Richal Dhand.
Sarfraz ...	Fair, but owing to its head silting it has usually ceased flowing early.	Its old mouth was cleared in 1904 with better results.	It is proposed to bund the present head and divert the supply from that into the Bhourko wah, leaving the old mouth to feed the Sarfraz.
Nur wah...	Was closed in 1896 on account of erosion, and arrangements made to irrigate the lands dependent on it from the Great Marakh, but it was re-opened in 1901-1902 after the erosion had stopped. There was some erosion in the past year.	*Nil.*	*Nil.*

During the course of my enquiries, I have visited and thoroughly inspected all the canals, and, in almost all cases, their mouths. I therefore submit the following comments on the Executive Engineer's report:—

The Ali Bahar Kacheri supplies in part dehs Gadali, Khutiro, Rahu, and Kaka, and is more important for the Shahdadpur than the Hala taluka. It has undoubtedly given an insufficient supply in the last few years, and the cause lies in its mouth, which is from a late-filling dhand in the Sakrand taluka. The Executive Engineer in his Inundation Report for 1904 admits this defect, and says that a plan and estimate for a new mouth have been sent in. For the coming season, he is giving the canal a cut from the Ren wah, which carries a superabundant supply, and I understand that it is possible that, if this cut works well, the canal will in future be fed wholly from the Ren wah without a direct mouth from the river.

The Sobho Chakar, a branch of the Ali Bahar Kacheri, which supplies in part dehs Gadali, Khutiro and Rahu, is a small but fair canal, which, however, suffers from the defective supply of its parent, the Ali Bahar Kacheri.

The Great Marakh, which supplies deh Lar and Chhapar Khan and parts of dehs Abrejani Saidabadji, Dethki, Amin Lakho, Ahanjo, Rahuki, Chhachhri, Zair Pir and Giss, is an excellent canal—the best in the division. It waters a far greater area in the Shahdadpur than in the Hala taluka.

The Jam wah Pingharo, a branch of the Great Marakh, which supplies dehs Jamali and Pingharo, and parts of dehs Kaka, Panjmoro, Abrejani Saidabadji, Dethki and Rahuki, is a small canal with a bad tail. In fact its real tail is a zamindari water-course called the Kario Lohano, which takes off from it in deh Kaka, about a mile before its end, and whose level is considerably lower than that of the Jam wah below its exit. It therefore carries off most of the supply in the canal, and, in addition to this loss, the Jam wah below the off-take of the Kario Lohano, having no depression or canal to fall into, silts heavily. Apart from this section below the off-take of the Kario Lohano, it seems to me a fair canal; but the zamindars complain much about it.

The Lohano, a branch of the Great Marakh, which supplies dehs Baori and Chitori and parts of dehs Rahuki and Zair Pir, is more important for the irrigation of the Shahdadpur than the Hala taluka. It is not a satisfactory canal, and silts heavily in spite of the new head, mentioned in paragraph 16 of Mr. Seymour's settlement report, which was given it in 1891-1892 to avoid silting. It seems to me that the fault lies with the new head itself.

The Gharo Rano is an important canal, or rather feeder, as on it the Lakhi wah and the Gharo Gahut, with 3 branches (1) the Small Marakh, from which the Paru wah issues, (2) the Awat, from which the Opau wah issues, and (3) the Malko Vanjheri—in all 7 canals—depend. The Gharo Rano itself only supplies dehs Nurketi and Kunar and parts of dehs Amin Lakho, Daluketi and Nuralabad. Since writing his remarks in the annexed report, the Executive Engineer has in the course of other correspondence said that even the new mouth of the Gharo Rano is not a good one. It is in fact subject to silting, and the river is withdrawing from it. None of the branches of the canal gives a satisfactory supply, except the Malko Vanjheri and the Gharo Gahut. The Executive Engineer has now on foot a scheme to employ the Gharo Rano to feed the Lakhi wah alone, and to supply the remainder of its branches from the Great Marakh. It is true that the latter is an excellent canal and carries a superabundant supply, which causes frequent breaches in the tails of its branches in the Shahdadpur taluka; but it will have to support a very large additional area, amounting to an average of 7,000 acres in the Hala taluka alone, in which at present it annually irrigates only an area of 2,300 acres. This fact has, however, been brought to the Executive Engineer's notice, and he estimates that, with an increased draw-off from the river, the Great Marakh will only lose 100 cusecs of its present supply, owing to the new cut, which it can well afford.

The Lakhi wah, which supplies deh Pir Bilawali and parts of dehs Gahot, Jamalabad, Rano, Tarah, Dabri and Bambhri, is not so much a branch as a

continuation of the Gharo Rano in and after deh Jamalabad. Its fault lies in its mouth, which suddenly narrows like the neck of a bottle from the end of the Gharo Rano. The water in the Gharo Rano on coming suddenly to this neck naturally piles up silt. The remedy seems to be to widen the Lakhi at its commencement. The zamindars complain, too, that the clearance of this canal has been neglected. It is certainly much silted, and considering the extent of cultivation that it serves (annually over 2,800 acres) and the badness of its working, the expenditure on clearance in the last 3 years has been very small.

The Gharo Gahut, which supplies parts of dehs Daluketi and Saidabad, is a short canal with a wide and deep bed, acting chiefly as a feeder to the Small Marakh, the Awat and the Malko Vanjheri, and carries a good supply as far as its own cultivation is concerned. After the off-take of the Awat wah, it ends in a lake called the Kolab Gahut, in which it annually wastes much water. From this lake, the Malko Vanjheri, a short and narrow but good canal, which from its origin is not liable to silt, takes its rise, and supplies parts of dehs Fatehpur, Gahot and Tarah. It cannot, however, flow until the Kolab Gahut is full, and I understand that the Executive Engineer proposes to give it a direct cut from the Awat, which will now be fed from the Great Marakh.

The Small Marakh, which supplies parts of dehs Abrejani Saidabadji Saidabad, Ahanjo, Chhachhri and Giss, is a short and very bad canal, which silts heavily for two reasons—(1) that its mouth is too broad for the volume of water the canal can carry, and (2) that its tail into the Great Marakh is kept closed to give a fuller supply to the Paru wah, which issues from it just above its end, and is somewhat above its level. This canal will now be fed, like other branches of the Gharo Rano, from the Great Marakh.

The Paru wah, which supplies parts of deh Chhachhri and Giss, after which it passes into the Shahdadpur taluka, is a small canal that suffers in its source of supply.

The Awat wah, which supplies dehs Bangalo, Nizamani, parts of dehs Saidabad, Fatehpur, Sohrabpur, Rano, Dabri, Bambhri, Kalri, Viraito and Giss, and much cultivation in the Shahdadpur taluka, is an important but unsatisfactory canal, on which a heavy expenditure for clearance (Rs. 5,450 in the last year) is annually incurred, with poor results. The fault seems to lie in its mouth. It will now be fed from the Great Marakh.

The Opau wah, which supplies parts of dehs Fatehpur, Sohrabpur and Giss, is a small canal with a mouth which is 2 or 3 feet above the level of the Awat, and seems to be subject to silting. The canal also suffers from the condition of the Awat.

The Gharo Bhanot, which supplies parts of dehs Nuralabad, Jamalabad, and Bhanot, passes mainly through forest land, and its chief object is to supply the Sarang and Ali Ganj canals.

The Sarang, which supplies dehs Sandan, Gaib Pir, and Narli, and parts of dehs Bhanot, Dabri, Kalri, Viraito, Ghoghat, New Hala, Kiria and Bhit Shah, is a moderate canal. The zamindars are in the habit of closing its tail, which escapes into a natural sandy hollow, and this practice must cause much silting, though on the other hand any water that falls into the hollow is wasted.

The Ali Ganj, which supplies dehs Bandh and Shekhani and parts of dehs Ghoghat, New Hala, Kiria, Chhar, Dhandho and Khanot, is a very fair canal with a good escape into the Sangro.

The Gharo Mahmudo, which supplies parts of dehs Jhirki, Old Hala, Ghotana, Khandu and Salaro, is an excellent canal, which was still flowing last year in the beginning of November, but the Executive Engineer now expresses doubts whether the dhand from which it rises will continue to be as favourable as it has been in the past few years. In his No. 7089, dated the 19th November 1904, Mr. Agashe mentions a project in connection with this canal, estimated

to cost Rs. 2,55,000, the details of which are more fully explained in his No. 7425, dated the 3rd December 1904. An account of a similar project, estimated to cost 2 lakhs, was given in paragraph 16 of Mr. Seymour's report in 1894, but this was never carried out, and the present plan is a revision of it, which was submitted more than two years ago, and of the undertaking of which there seems to be no immediate prospect. As the Executive Engineer says, the project, except that part of it which relates to the embanking of the Nasir wah, will not benefit the Hala taluka, which already gets a sufficient supply from the Gharo and its branches, so much as the Tando Alahyar taluka, into which these canals pass and where large areas of land are lying uncultivated for lack of water. The embanking of the Nasir wah will benefit the Hala taluka by rendering kharif cultivation possible in the Richal Dhand and the low-lying land surrounding it.

The branches of the Gharo Mahmudo are the Sangro, the Ali Bahar Tando Adam, and the Ghalu wah.

The Sangro, which supplies parts of dehs Ghotana, Khanot, Salaro, Khandu, Dhando, Chhar, and thereafter jagir lands, carries a sufficient supply as far as the Hala taluka is concerned, but there are many complaints about it in the Tando Alahyar taluka.

The Ali Bahar Tando Adam, in its short course in the taluka, supplies almost solely jagir land, the rayati dehs dependent on it being Nindhero, Khorkhani (part) and Kalri (part). It is a fair canal, and more important for the Shahdadpur and Tando Alahyar talukas than Hala.

The Ghalu wah, which supplies dehs Sartanpur, Pawharki, Palejani, Mubarak wah, and parts of dehs Bhanoki, Sekhat, Baudero, Sadri, Ganang, Dethki, and Sohki, has two mouths as the Executive Engineer says, but mainly depends at the end of the season on that from the Gharo Mahmudo. The supply channel direct from the river takes off from a dhand from which the river is receding and which seems likely to be abandoned altogether soon. It is a good canal, but mostly supplies very inferior soil.

The Khalkah, or, as it is called later in its course, the *Bhumphar*, is a branch of the Ghalu. Only dehs Bohri, Saidpur and Visro in the Hala taluka depend on this canal, which is chiefly important for the Tando Alahyar taluka, and is a very fair one.

The Nasir, which supplies dehs Jehki, Shahpur, and Sumra, and parts of dehs Richal, Abrejani Sekhatji, Pano, Tajpur, Sapki, Bhourko, Jiandal Kot, Barchani, Jakhri Joya, Ganang, Dethki, Sohki and Keti, is an important and good canal, ranking with the Gharo Mahmudo after the Great Marakh. It does not issue from the main stream of the Indus, but from a "wahur" or backwater, which, as long as its ends are open, is generally considered, I believe, the most favourable source of supply a canal can have, as it does not cause silting.

The Gun, which supplies parts of dehs Satar and Pano, and the *Khair*, which supplies parts of dehs Abrejani Sekhatji, Matiari and Satar, are small short branches of the Nasir Wah, having beds of a level considerably higher than that of the parent canal, and therefore flowing late and ceasing early.

The Sujawal, another branch of the Nasir, is a short canal, flowing into the Tando Alahyar taluka and only affecting a portion of one deh—Keti—in the Hala taluka. It is not a very good canal, and seems to have no proper escape and to be subject to silting.

The Sarfraz, which supplies parts of dehs Porat, Matiari, Sahib Sama, Jiandalkot, Barchani, Jakhri Joya, Sapki and Tajpur, is an important canal for the Hala, Hyderabad, Tando Alahyar and Dero Mohbat talukas, which a few years ago used to be one of the best in the Hala taluka, but is now in an unsatisfactory condition. The old mouth to which the Executive Engineer refers was, according to his Inundation Report, opened on the 12th September and ceased flowing after the 3rd October, long before the Nasir, Gharo Mahmudo, Ghalu and Great Marakh. It did not promise good results as it is fed from the same dhand that gives an unsatisfactory supply to the old Phulcli in the Hyderabad taluka. The Executive Engineer has now abandoned the project mentioned in the annexed report and is giving the canal a new head

from the same "wahur" that supplies the Nasir, at a point about a mile below the head of that canal, at a cost of Rs. 18,932. He estimates that the cost will be repaid in a single year of good cultivation, and the plan certainly seems a sound one.

The Bhourko, a branch of the Sarfraz, is a short canal, supplying parts of dehs Bhourko, Sahib Sama, and Jiandal Kot, and is supposed to flow from the Sarfraz and to fall into the Nasir wah. The level of its bed is about 4 feet higher than that of the Sarfraz, and it appears to have no slope from that canal to the Nasir, as it actually receives its earliest supply from the latter canal and then flows towards the former. Later, it is supplied from both canals and, having no fall to carry off the silt, it becomes choked. Now that the Executive Engineer has abandoned the plan of using the old mouth of the Sarfraz to supply that canal, that of closing its existing head and diverting its supply into the Bhourko will, I suppose, be also relinquished. I do not think it promised good results, even to the Bhourko.

The Nur wah is a short canal, which only supplies a portion of one deh—Amin Lakho—and then falls into the Great Marakh. It suffers much from silting, partly, it seems, because its head is too wide for the volume of water the canal is required to carry, and partly because it is suffering from erosion. It appears, however, adequate for its limited purpose.

A zamindari canal that is worth mentioning is the Kalian wah *ex* Gharo Mahmudo, which belongs to a jagirdar, Mir Sher Mahomed, and, besides watering 9 jagir dehs in whole or part, supplies the whole of deh Thora and parts of dehs Khorkhani, Kalri and Hakra in the Hala taluka and dehs Hingorani and Elehi in the Tando Alahyar taluka. The owner of this canal and his lessee are anxious to relinquish this canal to the Public Works Department, and I have addressed the Executive Engineer on the subject. He is making enquiries, but has expressed a preliminary opinion that there appears to be no objection to taking it over. I am told that the late jagirdar, Mir Alahdad, neglected the clearance of the canal, while demanding *hakabo* of Rs. 4 per "nar" from the cultivators on it. The present lessee, Mr. Hasasing, seems to have done good clearance. In taking it over, Government will not only gain by increased and steady cultivation, but by saving the rebate of 6 annas an acre for clearance which is given to cultivators on it.

The clearance allowance of 6 annas an acre for lift and 4 annas for flow is only given on the larger karias (33 in number), which are generally of a length of over 2 miles. On other karias (199 in number), it is 4 and 3 annas, respectively. The average annual amount of rebate given on karias of the first class during the last 10 years has been Rs. 3,974 and on karias of the second class Rs. 2,925-15-0. The system of rebate rarely works satisfactorily, except where karias are owned by a single zamindar. Partners in karias almost invariably quarrel, and either neglect the clearance altogether, or one man clears it, while the rest profit by it and draw the rebate, while refusing to pay any share of the expenses. The rebate allowed is in the case of first class karias certainly no more than the actual expenses would be, if they were properly cleared, and in the case of the second class karias is, I should say, much less, the karias being generally very deep and so faulty in alignment and fall that they seem designed to pile up silt rather than to carry water. But good clearance is rare.

A map showing in colours the portions of the taluka under each kind of irrigation accompanies this report as appendix II.

10. *Wells.*—Details are given in appendix XI. The number used for irrigation has risen from 150 in 1894-95 to 179 in 1903-1904, and the number for drinking from 229 in 1894-95 to 280 in 1903-1904, the total increase—a steady one—during the current settlement being 80. The area of cultivation exclusively on wells fluctuates a good deal, but has risen considerably during the current settlement, the average during the past 10 years being 49 acres 9 guntas, while in the previous 9 years it was 14 acres 10 guntas according to Mr. Seymour. The principal crops grown are wheat and vegetables in rabi. The water is sweet and good. In dehs bordering on the river, wells are generally 30 feet deep, the least depth out of many measured by the Mukhtiarkar being 25 feet; inland, their depth varies from 35 to as much as 70 feet, and is usually between 40 and 50 feet. The

construction of a well costs on an average Rs. 500, and the area that can be cultivated from one worked by a large wheel with good bullocks, is as a rule only some 4 acres as against an area of from 12 to 15 acres cultivable from a large wheel on a canal or tank. It is not surprising, therefore, that with canals available cultivation on wells should be so small.

11. *Previous settlements.*—The financial results of the previous settlements, which were reviewed at length in paragraphs 18 and 19 of Mr. Seymour's report, are summarised below by 2 tables showing the average areas occupied and cultivated (excluding uncultivated portions of Survey Nos.), demand (excluding alienations), remissions, collections and outstanding balances during convenient periods, the details of the first years of settlement being given separately, since they are not quite reliable on account of the excitement that follows on the introduction of a new settlement. The progress is shown at a glance by a comparison of the averages of the two settlements and of different periods within each.

I.

Major Taverner's (original or fallow-diffused) settlement, 1871-72 to 1883-84.

Year.	Occupied area.	Cultivated area.	Demand.	Remissions.	Collections.	Outstanding balances.
	A.	A.	Rs.	Rs.	Rs.	Rs.
First year of settlement, 1871-72	126,790	40,270	84,628	1,272	83,356	...

Average of the whole settlement ...	115,135	40,698	85,979	566	81,039	4,374

II.

Colonel Anderson's (temporary or irrigational) settlement, 1884-85 to 1893-94.

Year.	Occupied area.	Cultivated area.	Demand.	Remissions.	Collections.	Outstanding balances.
	A.	A.	Rs.	Rs.	Rs.	Rs.
First year of settlement, 1884-85	115,355	44,629	1,23,318	480	1,11,771	11,067
Average of 4 years from 1885-86 to 1888-89 ...	131,053	40,807	1,06,824	17	1,05,587	1,220
Average of 5 years from 1889-90 to 1893-94 ...	121,511	48,630	1,30,510	77	1,30,433	...
Increase	...	7,823	23,686	60	24,846	...
Decrease	9,542	...	...	...	...	1,220
Average of the whole settlement ...	124,712	45,101	1,20,316	93	1,18,628	1,595
Average of the previous settlement ...	115,135	40,698	85,979	566	81,039	4,374
Increase	9,577	4,403	34,337	...	37,589	...
Decrease	...	...	...	473	...	2,779

These figures do not agree with those in Mr. Seymour's report, which I found to be misleading and therefore corrected. (i) I have cut out alienations, with which the settlement is not concerned. (ii) Fallow assessment was first charged in 1889-90, and is thenceforth largely responsible for the increase in gross demand and remissions (on fallows resumed), and to some extent in collections. During the quinquennium 1889-90 to 1893-94, the annual average demand on account of fallow assessment was Rs. 16,433, the average amount remitted was Rs. 16,016, and the average amount collected was Rs 387. To preserve one principle throughout and to render comparison with the average of the first 5 years possible, I have excluded these figures from the average of the last 5 years of Colonel Anderson's settlement. (iii) Mr. Seymour's figures include the area of unauthorised cultivation and assessment thereon in 1892-93, but not in former years. Before 1892-93, the area of unauthorised cultivation was not given in any village form, and the assessment on it was lumped with "Miscellaneous" items. For the purpose of comparison, therefore, I have excluded from the average of the 5 years 1889-90 to 1893-94 the area and assessment of unauthorised cultivation in 1892-93 and 1893-94. (iv) In Mr. Seymour's tables, the heading "Cultivated area" includes the area of twice-cropped lands twice over; and (v) the heading of "Collections" includes "Choth," which is not an assessment on rayati, but alienated, land, and has therefore been excluded by me.

At the time of the last revision, the striking increase in cultivated area and revenue in the last 5 years of Colonel Anderson's settlement was attributed entirely to improvements in water-supply, but the question how far the lapse of alienated lands to Government was responsible for the increase was not considered. Details of such lapses before the year 1877-78 are not forthcoming, but from that year to 1883-84 7,380 acres 12 guntas, and from 1884-85 to 1893-94 3,466 acres 11 guntas, were resumed by Government from alienations. I have only been able to obtain very imperfect figures to show what extent of this land was taken up as rayati, but it must have been considerable. During the last half of Colonel Anderson's settlement, 1,506 acres 28 guntas lapsed to Government, of which 1,409 acres and 26 guntas were entered as occupied rayati land and 638 acres 26 guntas, paying Rs. 1,746, were cultivated in the year of lapse. After the year of lapse, it is impossible to say what extent of land thus resumed was taken up as rayati or to distinguish the assessment thereon from that on other land, but at any rate the actual advance in cultivation and revenue exhibited in the last half over the first half of Colonel Anderson's current settlement was not more than some 7,000 acres and Rs. 23,000.

12. *Current settlement.*—The current settlement is a continuation of the previous one in every particular. The following table gives the areas occupied and cultivated, excluding uncultivated portions of Survey Nos., the demand (excluding alienations), remissions, collections and outstanding balances during each year, and compares the average results of the second five years with those of the first five. The figures of the first year are included in the average of the first half as the settlement is merely a continuation of the previous one, and was in fact sanctioned with retrospective effect towards the end of its first year. Collections of conditional and fallow assessment are shown separately

from collections of assessment on cultivation:—

Year.	Occupied area.	Cultivated area.	Demand.	Remissions.	Collections			Outstanding balances.
					Of assessment on actually cultivated lands.	Of conditional and fallow assessment.	Total.	
	A. g.	A. g.	Rs. a.	Rs. a.	Rs. a.	Rs. a.	Rs. a.	Rs. a. p.

Decrease	2,473 0	...	...	...	...	...	...	...

Decrease due to an increase of 472 acres in uncultivated portions of Survey Nos.

The figures for each year of the current settlement include those of deh Giss, which, though not added to the Hala taluka till 1903-1904, has, for the purposes of this report, been taken as a part of the taluka during the whole settlement. In order, therefore, to compare the current with the previous settlement, it is necessary to deduct the following averages for that deh (excluding demand, collections, and remissions on account of fallow and conditional assessment) from the general average of the taluka:—

Deh.	Period.	Occupied area.	Cultivated area.	Demand.	Remissions.	Collections.	Outstanding balances.
		A. g.	A. g.	Rs.	Rs.	Rs.	Rs.
Giss ...	Average of 10 years from 1894-95 to 1903-04. ...	2,588 0	660 0	1,834	22	1,464	348

In addition, as pointed out in the preceding paragraph, the figures of the previous settlement do not include the area and assessment of unauthorised cultivation. These must therefore be excluded from the average of the current settlement, as under :—

Period.	Occupied area.	Cultivated area.	Demand.	Remissions.	Collections.	Outstanding balances.
	A.	A.	Rs.	Rs.	Rs.	Rs.
Average unauthorised cultivation from 1894-95 to 1903-04, excluding deh Gis.	930	930	2,639	...	2,527	112

After making these deductions, the average of the current settlement remains as follows :—

Occupied area.	Cultivated area.	Demand.	Remissions.	Collections on actually cultivated lands.	Outstanding balances.
A.	A.	Rs.	Rs.	Rs.	Rs.
118,721	49,042	1,32,255	893	1,26,055	5,307

showing the following results when compared with that of the previous settlement :—

	Occupied area.	Cultivated area.	Demand.	Remissions.	Collections on actually cultivated lands.	Outstanding balances.
	A.	A.	Rs.	Rs.	Rs.	Rs.
Increase	...	3,941	11,939	800	7,427	3,712
Decrease	5,991	...	...	...	...	...

In the current, as in the previous, settlement, several alienated grants have lapsed to Government and account to a considerable extent for the increase in assessment and nominal increase in cultivation. The following table shows the areas that lapsed in each year, and the extent to which they were taken up as rayati land and cultivated and assessed in that year :—

Year.	Total area of lapsed grants.	Area taken up as rayati land.	Cultivated area.	Assessment.	Remissions	Collections.	Outstanding balances.
	A. g.	A. g.	A. g.	Rs. a.		Rs. a. p.	Rs. a. p.
1894-95 ...	68 14	63 13	14 0	38 0	...	38 0 0	...
1895-96 ...	283 29	264 24	157 20	375 0	...	375 0 0	...
1896-97 ...	72 37	71 39	49 25	161 2	...	161 2 0	...
1898-99 ...	152 3	134 0	31 1	81 3	...	81 3 0	...
Total from 1894-1895 to 1898-99.	577 3	533 36	252 6	655 5	...	655 5 0	...
1899-1900 ...	806 32	740 23	411 34	1,089 15	...	1,089 15 0	...
1900-1901 ...	2,958 36	...	952 39	2,419 9	...	2,147 7 6	272 1 6
1901-1902 ...	105 13	102 25	60 8	165 13	...	165 13 0	...
1902-1903 ..	126 36	123 34	63 13	173 11	...	173 11 0	...
Total from 1899-1900 to 1902-1903.	3,997 37	967 2	1,488 14	3,849 0	...	3,576 14 6	272 1 6
Grand total ...	4,575 0	1,500 38	1,740 20	4,504 5	...	4,232 3 6	272 1 6

As remarked in the last paragraph, these figures only show the increase in cultivation and assessment due to the resumption by Government of alienated lands in the year in which they lapsed. After that year, these lands are merged with the general body of rayati land, from which it would be very difficult, if not impossible, to separate them, and show the extent of cultivation and assessment they are responsible for in succeeding years. The whole of the lapsed grant is not necessarily entered as occupied land in the year of its lapse. Thus, of the 2,958 acres 36 guntas forfeited in 1900-1901 not an acre was taken up in that year because the holders did not trouble to sign the usual agreement, and the area they cultivated was entered as unauthorised cultivation. This area, and the assessment on it, has already been included in the average of unauthorised cultivation which has been deducted above from the general average of the settlement, and if the remaining area of lapsed grants cultivated and the assessment collected on them be also deducted, it appears that, without allowing for increase in cultivation in lapsed grants taken up and cultivated after the year of lapse, the increase in cultivation and collections during the current over the past settlement has been no more than some 3,100 acres and Rs. 5,300, which is small, considering the increase in population. In the last half of the current settlement, there has been, after deducting from the average of that period the increase due to lapsed alienations, a decline from the first half, both in cultivated areas and collections on actually cultivated lands, of some 1,000 acres and Rs. 8,200. The falling-off is no doubt due to the series of poor inundations in the last half of the settlement.

The following table gives the causes of remissions in the current settlement. As usual in lift cultivation, which is independent of the few inches that make all the difference in the case of flow, the amount of remission due to failure of water-supply is small. The remissions caused by failure of crops have been distributed very equally over the whole taluka, and no part can be said to have suffered unduly :—

Year.	Failure of crops.			Uncultivated portions of Survey Nos.	Deterium.	Land acquired for public purposes.	Poverty.	Natal hurts.	Remission of assessment on fallow lands resumed.	Remission of conditional or first year's assessment.	Total.	Remarks.
	Owing to deficient water-supply.	Owing to injury by locusts.	Owing to injury by floods.									
	Rs. a.	Rs. a.	Rs. a.	Rs. a.	Rs. a.	Rs. a.	Rs. a.	Rs. a.	Rs. a.	Rs. a.	Rs. a.

The greater part of the arrears in each year has been due from estates under management and from large zamindars in embarrassed circumstances, whom it was thought advisable to save from further borrowing by granting postponement. They do not therefore show any undue leniency or slackness in collection or any difficulty on the part of the great majority of zamindars in meeting the demand.

13. *Collection of statistics and information.*—As this was my first touring season in the Hala division and my first experience of lift cultivation on a large scale, I began my tour earlier than usual and entered the taluka on the 15th October 1904, remaining in it, with small breaks, till the 8th January 1905. During this time, I thoroughly toured over the whole of it. The appendices were, as usual, prepared in the Mukhtiarkar's office, but, owing to various unfortunate circumstances, were not ready till after I had left the

taluka. Even then, many further corrections had to be made, and it was not till the middle of March 1905 that I got them complete. To the mukhtiarkar, Mr. Jhamrai Lahorimal, I am considerably obliged for the trouble and interest he has taken in supplying me with much useful information.

14. Details of increase or decrease in occupied land and unoccupied cultivable waste are given in appendix XIII, together with the causes of important variations, as far as they could be ascertained.

15. The extent of cultivation under each kind of irrigation is given in appendix XIV-A and illustrated in the map sent as appendix II. On the average of the settlement, 79·03 per cent. of the cultivation is kharif lift, 6·79 sailabi, 4·22 huris, 3·70 gardens, 3·55 kharif lift aided by flow, and 1·08 bosi, no cultivation under any other mode reaching 1 per cent. The percentage of kharif "other flow" is ·94 and of cultivation on wells is ·06.

16. In the last 5 years of the current settlement, as compared with the first half, there has been an increase in the annual average of gardens by 176 acres, of lift by 1,804 acres and of rabi barani by 472 acres, while there has been a decline in huris by 446 acres and in sailabi cultivation by 2,245 acres. There have been no other changes of importance in the totals of the taluka. The increase in gardens is mainly accounted for by a rise of 95 acres 25 guntas in deh Khandu, where the best garden lands are; the increase in kharif lift mainly by the lapse of jagir areas to Government in dehs Kaka, Baori, Chapar Khan, Tarah, Ghoghat, Tajpur and Jehiki, and also by the conversion of sailab into lift lands in the low inundation of the last 5 years and the felling and cultivation of huris; and the increase in rabi barani, which is chiefly found in dehs Khandu, Satar and Matiari, by the extraordinary rainfall of 1902. The greater part of the decrease in sailabi cultivation has occurred in the inland dehs, and is attributable to the high inundations of 1894-95 and 1897-98, which greatly raised the average of sailab cultivation in the first half of the settlement. Away from the low-lying river lands, sailab cultivation is more or less fortuitous. The chief riverain sailab dehs are Amin Lakho (decrease 20 acres), Jamalabad (increase 67 acres), Old Hala (decrease 81 acres), Khandu (decrease 37 acres), and Richal Sekhatji (increase 60 acres). In all these dehs, the sailab cultivation of the last year of the settlement is well above the average. In the riverain dehs of Ghotana and Salaro, there has been a decline of 175 and 156 acres, respectively, which I am at a loss to account for, as their conditions are much the same as those of Khandu. The decrease in huris is mainly found in dehs Amin Lakho (139 acres) and Ghotana (56 acres), where, owing to the neighbourhood of Government forests, their value for grazing is small, and in Pano (74 acres) and Satar (73 acres), where, judging by the country, they cannot have been very successful, and where the demand for the factory and inhabitants of Matiari would be a strong inducement to cut them down and sell them for fuel. In Rano, there has been an increase of 63 acres and in Kiria 45.

17. The kinds of crops grown and the areas occupied by each in the last 5 years are shown in appendix XII, in the last column of which the average percentage of the whole area occupied by each crop during this period is compared with that occupied by it in the 5 years 1888-89 to 1892-93 according to Mr. Seymour's report. The percentages have remained much the same. That of bajri is 61·25, and is followed at a long distance by cotton (16·36), juari (5·45), huris (4·34), jambho (3·42), wheat (2·69), gardens (1·83), tobacco (1·76), and pulses (1·19). The figures of dubari cultivation are given in appendix XII-B. The taluka is essentially a kharif one, the crops of that season forming 86·15 per cent. of the whole cultivation. It is remarkably poor in dubari cultivation. The rabi cultivation is found almost entirely along the low-lying land by the river. No new staples have been introduced during the current settlement.

Cotton is not limited to any well defined tracts, but can be grown wherever millets are. In low-lying tracts, however, where the soil is firm and hard, cotton is not usually successful, as it is said that it cannot force its roots

sufficiently deep into the soil, and moreover in these situations rank grass tends to spring up and choke its growth. Cotton being more paying than any other crop to the zamindars, there is thus a sort of natural compensation between high lands with an expensive lift, where cotton can be grown, and low lands, where the water supply is less costly but ploughing is more difficult and must be repeated oftener, and only millets can be successfully cultivated. That the area of cotton is not much larger than it is is attributable to the cost and labour involved in its cultivation and the exhausting effect it has on the soil. I think also that zamindars discourage it by the high cash rent they levy (*vide* paragraph 20). Sir Evan James, in forwarding Mr. Seymour's report to Government, said that the cotton grown in Hala was the finest in Sind. I think there must have been some misapprehension. Cotton from the neighbourhood of Maldasi in the Shahdadpur taluka is in general estimation, and to all appearance, the best in the Hala division, and the only cotton from the Hala taluka which is at all superior to the average quality of the division is that grown near Bhit Shah, the excellence of which appears to be due to more careful selection of seed and cultivation.

There is nothing remarkable in the methods of cultivation in the taluka. For kharif, the land is not usually ploughed till water enters the canals and is raised to moisten it. Farm yard manure, if used, is then ploughed in, and the ridges, divisions, and distributary water channels are made. Bajri, juari and cotton are sown broad-cast, til being usually sown with the last named crop along the edges of the distributary channels. There is no general rule as to the number of ploughings and waterings required. These are given according to the quality of the soil and the energy and means of the cultivators. Cotton and tobacco require or are given from one and a half times to twice as much water as bajri, and juari also requires about a third more water than the latter crop. I do not think that people in Hala over-water their cotton. They have no doubt a prejudice in favour of doing so, but this is counteracted by their natural laziness and the expenses of the lift. Cotton is usually manured, unless the land has been lying fallow long. Bajri and juari, unless near to villages or forest land, are usually left unmanured and grown after fallows of 3 or 4 years. Tobacco is always manured with goats' droppings, and the same land is cultivated with it year after year, yielding excellent crops, especially about Chitori and Bhit Shah. Bajri and juari are certainly the easiest and least expensive of the kharif crops, though less paying than cotton and tobacco, which require constant care. Cotton, for example, must be weeded two or three times at a cost which is said to be from Rs. 5 to Rs. 6 per acre each time. The only attempt at rotation is a common one of bajri and cotton in alternate years. This requires manure to be successful. I do not know whether it is scientific, but it seems to be based on the idea that bajri feeds by surface roots, while cotton strikes deep.

Of rabi crops, jambho is the chief. For the cultivation of this, the soil is merely broken up into rough lumps and the seed sown broad-cast. Wheat is a more paying crop, less exposed to frost than jambho, and can be grown wherever the latter is, but requires careful preparation of the soil and sowing with a drill. The preference of cultivators for jambho is no doubt mainly due to their laziness. In some cases, I have seen jambho and even wheat broad-casted without ploughing Manure is not used for any rabi crops, except gardens.

Banias make far better cultivators than Mahomedans, and the cultivation of garden crops and tobacco is almost entirely in their hands. Their cotton cultivation, too, is generally excellent, the seed being carefully selected, and the crop well manured, judiciously watered, and thoroughly weeded. When surprising contrasts between two neighbouring fields are found, it is usual to be told that the bad one is a Mahomedan's and the good one a Hindu's. Bania cultivators often gin selected cotton at home for the sake of the seed, or, if they do not run to this, procure hand-ginned seed from Bhit Shah. Of Mahomedans, a very few gin their own seed; a fair number round Bhit Shah procure hand-ginned seed from that town, but the majority resort from apathy or poverty to the cheap seed sold from the steam factories, though they know it is inferior.

I have only been able to find the record of one crop experiment in the taluka. This was conducted on bajri near Matiari by Mr. J. C. Pringle on the 2nd October 1899, and gave an out-turn per acre of 2,902 lbs. of grain, valued at Rs. 126-4-0, and 21,500 lbs. of straw, valued at Rs. 88-12-0, total Rs. 215, on which an assessment of Rs. 2-12-0 gives an incidence of 1·19. The crop seems to have been an extraordinary one, and the price of the straw must have been much more than usual, on account (probably) of the absence of rain and scarcity of fodder. Deducting the value of the straw, of which (*vide* paragraph 20) the zamindar only gets a few bundles to feed his horses and cattle, the remainder going to the hari, there remains a sum of Rs. 126-4-0 on account of the value of the grain, of which the zamindar would get one-third or Rs. 42-1-4 to pay an assessment of Rs. 2-12-0.

When I began my tour last year at Matiari in the Hala taluka, before the middle of October, I expected to find most of the millet crops standing, but actually found almost all reaped. I was therefore unable to find anything like an average crop, and had a choice between some very bad and uneven crops, which it would have been difficult to cut with discrimination, and one good and even one. I chose the latter. The experiment gave an out-turn per acre of 1,788 lbs. and 3 tolas of grain (valued at Rs. 43-8-8) and 325 bundles of straw, weighing 6,330 lbs., and valued at Rs. 42-3-10. On the value of the total yield per acre, Rs. 85-12-6, an assessment of Rs. 2-12-0 gives an incidence of 3·21. The zamindar's share of one-third of the grain would be Rs. 14-8-3 an acre, out of which to pay an assessment of Rs. 2-12 and meet the expenses of clearance and maintenance. The value of the straw was 4 times what it would usually be on account of the entire absence of rainfall and the scarcity of fodder. The land was well manured and the crop unusually carefully cultivated, and gave a very good result. The interest of the experiment lies in the fact that the inundation was poor and the canal on which the crop was raised the Khair *ex* Nasir wah, an indifferent one, which ceased flowing early in September. The expense and trouble incurred over this crop must have been much greater than usual, but the result shows what can be done in a poor year on an indifferent canal. In these experiments, however, the crop is so carefully threshed that not a grain is wasted, and when the yield of the small area cut is converted into so much an acre it gives much more than the zamindar would in practice get. An average crop of bajri under normal conditions would yield from 12 to 16 maunds of grain an acre.

I was unable to make any experiments in cotton or tobacco, the only other kharif crops open to me, as one in cotton would have involved frequent returns to the same spot, and tobacco is, according to the practice of the country, kept months drying and curing before it is disposed of. Later, if possible, I mean to make some experiments in wheat and jambho near Old Hala.

In forwarding Mr. Seymour's report to Government, Sir E. James remarked that he should have gone into the average areas cultivable from a wheel and the returns from them on the different canals. I have not attempted to do so because the areas vary greatly on each canal according to the level of the land it passes through, but the area that can be cultivated from a single large wheel or "nar" by good bullocks working night and day can rarely be more than 15 acres. 4 pairs of bullocks are required to work a wheel, and I give an estimate of the monthly cost of feeding them, where, as over most of the taluka, there is no natural grazing :—

Oil-cake at the rate of 1 lb. for each animal per day at Rs. 2/8 per maund	Rs.	7	12	0
Cotton seed at 2 lbs. for each animal per day at Re. 1/8 a maund	„	9	4	0
Bajri straw at the rate of 1 large bundle for each animal per day at Rs. 8 a hundred bundles ... Say	„	20	0	0
	Rs.	37	0	0

Taking the season during which the bullocks work as 4 months, the total cost of feeding them during that time comes to Rs. 148, which would work out to a cost of about Rs. 10 an acre. More than that, however, they have to be maintained throughout the off-season, though at a smaller cost. The payments to the village workmen exclusively employed in the case of wheel cultivation may be taken (paragraph 20) as 6 kasas per wheel to the carpenter, 6 kasas to the potter, and 3 kasas to the mochi—the value of these 15 kasas at Rs. 48 a kharar being Rs. 12. Further, there is the capital cost of the wheel (about Rs. 30), apart from the expense of major repairs to it, for which the carpenter has to be paid extra, and of the bullocks (Rs. 40 to Rs. 60 each) to be taken into account, and the fact that 4 men and a boy are required to work one wheel. The enormous difference in cost between lift and flow cultivation, under the latter of which 1 pair of plough bullocks, which may be borrowed, and 2 men would suffice for 15 acres, is thus apparent.

18. *Prices.*—These are given in appendix XIX. Unfortunately, official figures for the first 5 years of the current settlement are not available in the taluka office, where prices were not recorded before the year 1899-1900. The Mukhtiarkar has therefore supplied them from traders' books, but there is this defect in them that, while the official figures are obtained by striking an average in the prices of 12 months, those obtained from the banias are only the averages of the months for which details were available, the current prices in several months not being forthcoming from the books. Such as they are, however, they are given, and the average of the first 5 years is compared in the appendix with that of the second, showing an all-round increase in the second period, except in tobacco and jambho. Similarly, I have compared the average of the current with that of the previous settlement, according to the figures given by Mr. Seymour, which have been reduced to maunds by the calculation given at the head of each column. At the same time, the figures of the previous settlement must be taken with some caution. They are not official, as prices were not recorded in the taluka office before 1899-1900, and I notice that the Commissioner, in forwarding Mr. Seymour's report to Government, remarked in paragraph 7 of his letter that the price of bajri, according to Mr. Seymour's figures, had fallen from Rs. 54 to Rs. 42 per kharar, while, according to the Collector's figures, it had risen from Rs. 39 to Rs. 61. The printed papers relating to the settlement of this taluka, however, contain no list of prices furnished by the Collector. I have reduced Mr. Seymour's kharars to maunds according to the measures prevailing at Hala, where I assume the prices were ascertained, but there are some wide differences between local kharars in various parts of the taluka. The Mukhtiarkar ascertained the prices for the first 5 years of the current settlement in Matiari, as they were not available elsewhere, but he ascertained them in maunds, in which also the record in the taluka office has been maintained since 1899-1900.

The comparison of the average of the past with that of the current settlement shows a general increase, except in the price of tobacco, which has fallen 1 anna a maund. I have no doubt, even if the figures of the past and the first 5 years of the current settlement cannot be unreservedly accepted, that there has been an increase, due to some extent, but by no means wholly (as notably in the case of cotton, the price of which is dependent on the European market), to the direct connection with Karachi given by the railway. Practically, the only prices that affect the general prosperity of the taluka are those of bajri and uncleaned cotton. The average price per maund of the first has exceeded by annas 3 and 1, respectively, its price in the past, and the first 5 years of the current, settlement, while uncleaned cotton shows a similar rise of one rupee and eleven annas, respectively, in the same periods. Excluding, however, the extraordinary year of 1899-1900, when the price of bajri was raised by famine to Rs. 3-9-0, the average price of that staple in the current settlement has been Rs. 2-1-8, or Re. 0-1-8 more than that of the past settlement, and its average price in the last 4 years has been Rs. 2, or the same as that in the past settlement, and 3 annas less than the average in the first 5 years. The method of ascertaining the current prices by striking an average of 12 months is not very satisfactory as the highest prices may very likely prevail in the months when there is the least production; but it is hard to suggest a better method.

19. The details of sales and mortgages during the last 10 years are given in appendices VII and IX. In all, 17,991 acres, assessed at an average rate of Rs. 2-10-0 an acre, have been sold at an average rate of Rs. 13-10-10 an acre, or little more than five times the Government assessment, and of these 7,470 acres have passed from Mahomedans to Hindus at a little less than Rs. 13-10-2 an acre; 50,445 acres have been mortgaged at an average rate of Rs. 4-12-10 an acre, or less than twice the Government assessment, and of these 11,807 acres have been mortgaged by Mahomedans to Hindus with possession and 30,692 acres without possession.

Of the 11,807 acres mortgaged with possession by Mahomedans to Hindus during the last 10 years, no less than 7,796 were so mortgaged in 1,902 out of a total area mortgaged in that year of 9,974 acres. In the same year, 2,860 acres were sold—much the highest number in any year. The inundation of 1902 was exceptionally bad, but its effect must have been mostly felt in 1903, and the sales and mortgages in 1902 must be attributed to the sudden closing of the Mahomedan cultivator's credit by the introduction of the Deccan Agriculturists' Relief Act and the amendment of the Land Revenue Code. The fact that the banias evidently demanded in 1902 mortgage with possession and refused to advance money as usual on mortgage without possession is another proof that the abnormal figures of that year must be attributed to these Acts rather than to the season.

The figures of sales and mortgages during the last 10 years are, however, considerably better than those of the 9 years reviewed by Mr. Seymour, as the following comparison shows :—

Sales.

Period.	No. of cases.	Area.	Total sum for which sold.	Sale rate per acre.	Total assessment.	Average rate per acre.	Passed from Mahomedans to Hindus.	
		A. g.	Rs. a.	Rs. a. p.	Rs. a. p.	Rs. a. p.	A. g.	Rs. a. p.
1884-92..	506	43,883 4	2,31,3 0 14	5 4 4	1,26,741 0 0	2 14 3	10,510 0	53,916 0 0
1894-03..	573	17,991 10	2,46,095 5	13 10 10	47,255 3 10	2 10 0	7,469 35	1,02,480 14 0

Mortgages.

Period.	No. of cases.	Area.	Sum for which mortgaged.	Mortgage rate per acre.	Total assessment.	Average rate of assessment.	By Mahomedans to Hindus with possession.		By Mahomedans to Hindus without possession.	
		A. g.	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.	A. g.	Rs. a. p.	A. g.	Rs. a. p.
1884-92 ...	366	101,858 25	2,30,07' 5 0	2 2 5	2,79,912 6 0	2 9 10	36,916 23	57,962 0 0	50,258 17	1,13,452 2 0
1894-03 ...	383	50,445 7	2,12,347 11 4	4 12 10	1,.7,118 9 10	2 11 6	11,807 2	25,105 11 11	30,691 39	1,30,847 7 9

It was evident that there must soon be a limit to the progress shown in the terrible figures of Mr. Seymour's report, if it was only attained by all the land passing into the hands of Hindus, and the decrease in acres sold and mortgaged would not by itself be much evidence of prosperity, but the prices fetched show that land has in the last 10 years more than doubled its value in the preceding 9 years. But it cannot even now be said to be high.

The advent of the railway is, I think, responsible in some—but not in a large—measure for the rise. Thus, the average rate at which land was sold during the 10 years being Rs. 13-10-10 an acre and that at which it was mortgaged during the same period being Rs. 4-12-10, the following were the rates per acre fetched during the years preceding the opening of the Kotri-Rohri line (16th November 1896) .—

Year.	Area sold.	Rate per acre.	Area mortgaged.	Rate per acre.
	A. g.	Rs. a. p.	A. g.	Rs. a. p.
1894	1,286 23	11 5 7	5,674 26	4 12 2
1895	1,485 39	10 7 4	10,588 26	3 3 7
1896	21,024 0	10 4 0	6,471 6	7 0 4

The taluka, being on the river and near Hyderabad and Kotri, has always been well off in its communications, so that the advent of a railway into the taluka itself would naturally not make the difference that it would do in a remote district.

The reliability of the figures in appendices VII and IX for giving the true value of land is sometimes questioned. There may be good reason for doubt in the case of mortgages of land, which are almost all made by Mahomedans to Hindus and which are often governed by the necessity of renewing previous loans on any terms. But as regards sales, out of the 17,991 acres sold during the past 10 years, only 7,470 have passed from Mahomedans to Hindus, and a considerable part of the remaining 10,521 acres may be presumed to have been sold freely and at the market rate As noted above, the land that passed from Mahomedans to Hindus was sold at an average rate of a little less than Rs. 13-10-2 an acre, and the average sale rate per acre of the remainder, which passed from Mahomedans to Mahomedans or from Hindus to Hindus or Mahomedans, was only Rs. 13-10-4, so that it does not appear that Mahomedans have generally been forced to part with their lands to Hindus for unduly low prices.

20. *Tenures.*—A statement of sub-lettings is given in appendix VIII. Only leases duly registered are included in this statement, their periods being generally for a number of years, during which time the occupant of the land surrenders it with all rights and duties to the lessee, who clears the watercourses, cultivates it, and pays the assessment to Government and the stipulated rent to the lessor. Often, the rent, instead of being spread over a number of years, is paid in a lump sum at the commencement of the period, the object of the lessor being to raise money at once. The lease of land to a creditor is a common method of paying debts, the lease money, nominally paid, being actually credited to the debtor's account, and the creditor undertaking to return the land at the close of the period. It is not remarkable, therefore, that the rents fetched are very low, the average for 83,213 acres during the 10 years of the settlement being only Rs. 1-1-4 per acre against an average assessment of Rs. 2-10-11. Even so, however, the figures are an improvement over those given by Mr. Seymour for the 9 years 1884-1892, during which 65,190 acres, assessed at an average rate of Rs. 2-12-9 per acre, were leased at an average rate of Re. 0-10-4 an acre. From figures kindly furnished by the Manager, Incumbered Estates, it seems that the estates under his care in the Hala taluka when leased out fetch on an average a net income equal to the Government assessment which the lessee pays. The total figures for the last 3 years are as follow :—

Year.	No. of estates.	Lease money.	Assessment.
		Rs.	Rs.
1901-02	15	7,642	8,460
1902-03	14	7,795	7,817
1903-04	18	8,742	9,744
TOTAL ...	...	24,179	26,021
AVERAGE ...	...	8,059	8,673

Yearly leases, if they can be called such, by which zamindars sometimes give out whole Numbers on a cash rent—called "lapo," "dhal," and "errio"—for one year to haris, are not included in appendix VIII, because the agreement is rarely, if ever, reduced to writing, when the zamindar is a Mahomedan. Such a tenure, though the prevailing one in the neighbouring Tando Alahyar taluka, is not common in Hala, though in one or two places in the north it seems on the increase. The rent varies greatly between Rs. 5 and Rs. 14 per acre according to the quality of the soil, the supply of water, the position

of the Number, according as it is on the bank of a canal or karia (it pays much more in the former position on account of an assured supply of water, though the zamindar escapes all expense on account of clearance) and its nearness to a village, not because it is a market but because of the manure to be found there. Generally, a hari who takes up a whole Number on a cash rent is entitled to grow anything and to any extent he pleases, the zamindar bearing the difference of assessment, if the hari grows a garden crop or cultivates a portion of the Number in rabi after kharif. I have found instances, however, of a self-adjusting system of rent, in one of which the hari paid Rs. 6 an acre for kharif cultivation (bajri) and the same amount for subsequent rabi dubari cultivation (jambho), and in another of which he paid Rs. 8 an acre for kharif cultivation (cotton) and Rs. 4 an acre for subsequent rabi dubari cultivation (vegetables).

The reasons for giving out whole Numbers on a cash rent vary. In some cases, it is the poverty of the soil. In the Tando Alahyar taluka, I am inclined to think that the prevalence of this tenure is or was due to a poor and uncertain water-supply, the canals in that taluka being all "tails" of canals that have passed through other talukas, and the zamindars consequently preferring a small fixed profit to gambling on the chance of a greater one. On the other hand, Numbers with a good soil and water-supply, the whole area of which is to be cultivated with cotton, vegetables, or tobacco, are given out on a cash rent because the nature of the first two crops is such that the owner risks being cheated by the cultivator on a division of the produce, which is gathered at frequent intervals, while tobacco takes a long time to mature, and the zamindar wants his rent as soon as possible, and in most cases would not know how to cure the leaf himself.

In the Hala taluka, land cultivated with food-grains is most commonly given out on "batai," zamindars, unless too lazy or too dignified, retaining a "wheel" which they work themselves. The following are the customary shares zamindars receive of the chief crops:—

Crop.	Season.	Mode of irrigation.	Zamindar's share.
Bajri and juari ...	Kharif ...	Lift... ...	Generally $\frac{1}{3}$rd: sometimes $\frac{2}{5}$ths, $\frac{2}{7}$ths or $\frac{1}{4}$th.
Do. ...	Kharif ...	Flow ...	Rarely $\frac{1}{2}$: generaly $\frac{1}{3}$rd: sometimes $\frac{2}{5}$ths.
Wheat and barley..	Rabi ...	Sailabi ...	Generally $\frac{1}{3}$rd: sometimes $\frac{1}{4}$th.
Jambho and sariah			

The above shares are of the threshed grain alone and not of any by-products. In the case of bajri and juari, the zamindar gets from 20 to 120 bundles of straw and a few baskets of ears of grain thrown in per "nar," or large wheel (say, 12 to 15 acres of cultivation). The straw is not for sale, but for his horses and cattle, and the amount demanded varies probably according to his requirements. Zamindars are rarely large cattle-owners, and generally only keep a few buffaloes and cows for their household use. The ears of grain are also, nominally at least, for the zamindar's horses, but it is said that this is often the zamindar's pretext for getting more than his due. Whether he gives out the land on "lapo" or "batai" for one year, the zamindar remains responsible for the clearance of the water-course.

The system of dividing the produce among the men who help to work the wheel is as follows. A large wheel or "nar," which is far commoner in this taluka than the small wheel or "hurlo," ordinarily requires 4 men and a boy—who does odd jobs—and 4 pairs of bullocks to work it. Camels, each of which is reckoned as equal to a pair of bullocks, may replace 2 or 3 pairs of bullocks, but a pair of bullocks must be kept for ploughing. At the time of reaping, the reapers are paid in kind—generally $\frac{1}{20}$th of the amount they reap. Then

the shares of the village workmen are set aside. They vary considerably according to the custom of different localities, but an instance of the practice prevailing in the neighbourhood of Bhambhra may be given to show the nature of the services rendered by the workmen. There, the carpenter gets 6 kasas per wheel, for which he puts together and sets up the wheel, and makes handles for sickles, and, if he is supplied with the wood, the rim bars that carry the pots on the wheel. For the construction of the wheel or any other of its parts, he is paid extra. The potter gets 6 kasas per wheel, for which he supplies all the pots necessary for the wheel and for the households of its workers. The "mochi" gets 3 kasas per wheel, for which he supplies the pads and leather work in the harness of the animals that work the wheel. The blacksmith gets 3 kasas per wheel, for which he supplies 2 sickles and 2 steel plough-heads a year and sharpens the haris' instruments. All other instruments and requirements must be paid for extra. The barber may take 6 kasas per wheel or one "bora" (= 2 head-loads) of cars and 2 kasas of grain per wheel, as the owner of the wheel and he agree. For this, he attends the haris of the wheel throughout the year. The mullah gets 1½ kasas per wheel. After deducting these shares, the zamindar's share according to the terms of the batai is then set aside. The remaining produce is then divided among the haris, each man and each pair of bullocks, or each camel, being entitled to one "vandhi" or share, the boy to a "kachi vandhi" or half a share, and the "mujeri," or owner of the wheel, who has taken the Number from the zamindar and is responsible to him for his share of the produce or rent, or who may be the zamindar himself, to an extra half share. Thus, if there are 4 men, including the "mujeri" and 3 assistants, 4 pairs of bullocks, and 1 boy, there will be 9 shares, out of which, if each of the 4 men has provided a pair of bullocks, the 3 assistants will get 2 shares each, the mujeri 2½ and the boy ½ a share.

It should be noticed that the zamindar gets his share not out of the gross produce, but out of the net produce after the reapers and village workmen have been paid, and that he thus contributes to pay them.

When lands cultivated with millets are given out on lapo, the rent varies from Rs. 5 to Rs. 8 an acre, the commonest rate being Rs. 6, with from 15 to 100 bundles of straw and a few baskets of ears of grain per wheel thrown in for the zamindar.

In some parts of the taluka, lands producing wheat, barley and oil-seeds are given out on lapo which, in the case of the fine sailabi lands near Old Hala, has been forced up this year by the competition of the haris to as much as Rs. 20 an acre, and in the case of the lands near Amin Lakho varies from Rs. 6 to Rs. 10 an acre.

As noted above, the batai system is not a safe one for the zamindar in the case of cotton, tobacco, and garden crops, though some Sayads near Matiari give out cotton on lapo, and estimate the probable out-turn with the aid of "amins" before the first picking. It is rare to find a whole Number cultivated with cotton or tobacco. Usually, millets are grown in the same Number as these crops, and in this case, if the whole Number has not been given out on cash rent for the year, the produce of the millets is divided, as usual, between the zamindar and the haris, and a fixed cash rent is paid per "jireb" (half acre), according to actual measurement of cotton or tobacco. The rate for cotton on lift irrigation varies from Rs. 6 to Rs. 10-10 an acre, the commonest rates being Rs. 8 or Rs. 8-8. Cotton on flow irrigation is not common, but in the neighbourhood of Bangalo I discovered that the lapo exacted on it was Re. 1 an acre higher than that taken on "lift" cotton. No difference seems to be made between cotton grown on lift and on lift aided by flow. A curious and not altogether honest practice has arisen in some dehs in the north of the taluka by which the zamindars take an extra anna in the rupee of the lapo, which they call "local fund," their explanation to the haris being that this is to cover the Local Fund cess they are charged by Government. They are considerable gainers by this ingenious method, as, while they pay 3 annas an acre Local Fund Cess on the assessment of Rs. 2-8 or Rs. 2-12 an acre, they collect an extra 8 or 10 annas an acre according as the lapo is Rs. 8 or Rs. 10 an acre, at the same time leaving

the haris satisfied. This practice is not by any means universal in the north of the taluka and is not found in the south, but it may spread, unless the haris discover the deceit and refuse to pay.

The zamindars assert that their reason for exacting a heavy "lapo" on cotton is that when it is grown, as it is commonly, in the same Number as bajri or juari, the hari neglects the millet crop to water the cotton, which they say requires from one-and-a-half times to twice as much water as millets, and which the haris find much more profitable. Their reason for an equally heavy "lapo" on tobacco, which is also given much more water than millets, appears to be the same. This explanation, though not creditable to the supervision of the zamindars over their haris, contains some but not all the truth. It is a fact that haris neglect millets in the same Number as cotton and tobacco to tend the latter crops. No other hypothesis will account for the common spectacle after the late poor inundation of good cotton and tobacco by the side of very indifferent bajri. Another proof is that, when a whole Number is leased out on a cash rent to be cultivated with cotton or millets as the lessee pleases, the rent per acre is considerably less than that charged on cotton grown in the same Number as bajri the produce of which is divided. Thus, I have found a whole Number cultivated with cotton and bajri leased out at Rs. 6 an acre beside a Number in which the produce of bajri was divided and the cotton assessed Rs. 10 an acre. At the same time, an intelligent Amil zamindar in the Shahdadpur taluka told me that he certainly would not permit his haris to neglect the millet for the cotton crop, and that his reasons for taking Rs. 4 an acre from his haris for cotton were that that crop was much more profitable to the haris than bajri and that it exhausted the soil more. Zamindars do not always insist on the full amount of "lapo" being paid. They have to remit or postpone a certain amount in bad seasons, especially if they wish to retain a good hari for another season. Good regular cultivators and those who are well enough off not to need advances in money from the zamindars often get land on easier terms (*e. g.*, on a rent of Rs. 4 per acre instead of of Rs. 5 for cotton and on batai of $\frac{1}{4}$th instead of $\frac{1}{3}$rd) than others.

Garden lands, when leased out without any obligation on the part of the owner beyond the clearance of water-courses, generally fetch a rent of Rs. 10 an acre, but the owner, if a Mahomedan, often undertakes to supply water, while the cultivator, usually a Hindu, supplies the seed and labour and takes the produce, paying the owner a fixed rent. This practice is the commonest in the case of well lands, the owner of which supplies the bullocks and works the wheel for a fixed cash rent of from Rs. 60 to Rs. 80 an acre. The difference in rent between the two systems gives an idea of the cost of working a wheel. The produce of fruit trees in gardens is often leased out separately from the vegetables for a lump sum, the owner of the garden supplying the water, manure, and labour throughout the year, and taking some of the fruit for himself as a "dali."

The respective shares of the zamindar and haris in batai do not seem to have undergone any alteration during the current settlement. Custom often governs them. In the case of some good lands in deh Fatehpur, where the zamindar's share is only $\frac{1}{4}$th, certain haris whom I questioned admitted that the soil and water-supply were good, but accounted for the low rate of batai by custom. Generally speaking, too, over almost the whole taluka the demand of the zamindars for cultivators is still greater than the supply, and the zamindars are often on such bad terms with one another or so indifferent to their common interests that they readily engage cultivators who have dishonestly deserted other zamindars in the neighbourhood, leaving their debts unpaid and without any intention of paying them, and even lay themselves out by offering more liberal terms to attract one another's haris.

For similar reasons, the rates of "lapo" are in most places the same as they were in 1894 when, Mr. Seymour states in paragraph 34 of his report, they varied from Rs. 5 to Rs. 10 an acre. Apart from the deh of Hala Purana, where the somewhat cut-throat competition of the haris has—perhaps, temporarily—forced up the rate of lapo on sailab lands, I have only come during my enquiries across three dehs where the general rent is said to have been comparatively

lately raised. These were the dehs of Bangalo, Nizamani and Kalri, where I was told by a zamindar that the lapo on cotton was raised some ten years ago from Rs. 8 to Rs. 10 per acre. I imagine, too, from the limited area to which the practice of exacting an extra anna in the rupee as "Local Fund" is confined, that this must be a modern institution. The Mukhtiarkar informs me that he has learnt that the rate of lapo in deh Jiandal Kot was raised from Rs. 6 to Rs. 6½, 2 years ago; but that is so low, considering the advantages that parts, at least, of that deh enjoy, that I am inclined to think that it must be more ancient. It is not altogether safe to trust to the Sindhi's ideas of time.

The relations between zamindars and their haris are fair, but the latter are an independent class, who can almost always be sure of employment, and a zamindar who gets a bad name for being unjust or over strict with his haris is a ruined man, as more than one instance shows. Apart from cultivation, zamindars in this taluka have little or no control over their haris, unless they enjoy a religious influence as Sayads and Pirs.

A nominal roll, showing the growth or decrease of the principal estates during the current settlement and the financial condition of the owners, is given as appendix XX. Out of 53 Mahomedans in this list, 30 are more or less in debt. The Hindus are generally well off.

The only agricultural improvement worthy of mention that has been effected during the current settlement has been the introduction in the past season of a steam pump of 10-horse power by Pir Fazul Khiun of Matiari to irrigate some 800 acres newly granted him in deh Bohriun. This Pir is the son of an Afghan refugee, and is worth half a dozen Sindhis in energy and foresight.

21. The general condition of the cultivating class is, I think, certainly better than it was at the commencement of the current settlement, as revealed by Mr. Seymour's report. It is not prosperous, but improving. Very many of the Mahomedan cultivators still raise money by selling their cotton crops in advance to factory owners at a half or two-thirds of what the market price will probably be, and Messrs. Ralli Brothers' agent at Tando Adam informed me that one-third of the cotton that comes for ginning into that town has been bought in this way. Decrees against agriculturists in all the talukas of this division are also constantly passing through my hands for execution, though, to some extent, this is perhaps not so much an evidence of embarrassment as of civilisation. But the value of land has risen, the number of wells dug has increased, and personal enquiry among cultivators shows that many even of the haris manage to cultivate without resorting to loans from their zamindars or banias, and the majority of the zamindars, being small land-holders of little position, live simply and are not inclined to waste their money in ostentation. The extent to which land has passed from Mahomedans to Hindus has been shown in paragraph 19. It has not thereby passed into the hands of "non-agriculturists," the Hindu money-lender being often considerably more of an agriculturist than the kind of Mahomedan who loses his land.

22. The only form of pressure used in collecting revenue during the current settlement seems according to the Mukhtiarkar's report to have been the issue of notices under section 152, Land Revenue Code. The Sindhi is very sensitive to loss of reputation, and a threat of attachment of his land or moveable property is generally sufficient to make him pay up, if he possibly can. Notices themselves mean nothing, and are usually issued quite unnecessarily. Many of the zamindars are ignorant of the time of payment till the tapadar's kotar comes to summon them. The details are as follow:—

Year.	No. of notices.	Amount of arrears.	Year.	No. of notices.	Amount of arrears.
		Rs. a. p.			Rs. a. p.
1894-95 ...	789 ...	30,672 4 0	1899-00 ...	1,017 ...	31,960 11 0
1895-96 ...	403 ...	11,568 14 0	1900-01 ...	1.161 ...	40,331 5 0
1896-97 ...	465 ...	17,551 6 0	1901-02 ...	781 ...	32,755 5 0
1897-98 ...	836 ...	54,016 2 0	1902-03 ...	925 ...	32,822 14 0
1898-99 ...	1076 ...	42,821 10 0	1903-04 ...	943 ...	8,029 13 0

The arrears existing at the end of each year are shown in appendix XV and paragraph 12, where I have commented on them in connection with the working of the current settlement.

23. *Grouping*.—For the purposes of assessment, the dehs in the taluka were divided by Colonel Anderson in 1884 into 2 groups, in which they have remained ever since without change. Of those in the 2nd class, some were placed there because their low-lying situation on the river's bank and exposure to floods had impaired their fertility by causing the growth of rank grasses, and the remainder on account of the liability of their roads, water-courses and soil to the encroachment of drifting sand-hills. At the time of grouping them, practically no account was taken of advantages in communication, though the inequalities in this respect were much greater then than they are now. In Sind, considerations of water-supply, level, population and the general character of the soil always seem to have been the main factors in determining the grouping of dehs, and communications have assumed a very secondary importance. The question is whether any changes in grouping are called for in Hala on account of the opening of the Kotri-Rohri Railway. I have already dealt with this to some extent in paragraph 5, where I have pointed out that the effect of the railway has been to level the differences between the north and south of the taluka by giving direct connection with Karachi and abolishing the importance of Hyderabad, and between the east and west by providing stations on the east to counterbalance the ferries and river route on the west. The necessity for alteration in the grouping on account of communications is, then, much less than it was in 1884. I would note in addition the following points :—

(*a*) The stations of Sarhari and Alahdino Sand are in unimportant hamlets. Those of Lundo, Udero Lal, Khatian Road, and Khesano Landhi are in the open plain, the nearest villages being some miles away. There are no ginning factories at or near any of them. Consequently, the sole advantage over others that dehs near them enjoy is a greater facility in exporting their bajri, juari and til to Karachi. Of these, only the first product need be considered. (Wheat and oil-seeds are not grown near any of these stations, except, it may be, in trifling quantities.) If the zamindars had the enterprise or the capital to send their bajri direct to Karachi themselves, no doubt they would enjoy a much greater advantage than they do by being near a station. As it is, it by no means follows that because they are near a station it is always of use to them. They are in the hands of the bania who buys from them, whether he decides to send the produce at once to Karachi or to wait for a rise and meanwhile to store it in his godown, it may be some distance from the railway, or to dispose of it in some inland town or village. These stations are only outlets of export : they are not situated in towns or villages where there is any demand for local consumption. Consequently, if there is no demand in Cutch, as in 1903-1904 after a good rainfall, the dehs near these stations are in no better but in a worse position than those near the towns and large villages further inland. Moreover, any facility they enjoy in the disposal of bajri is more or less equalised by disadvantages in the disposal of cotton which has to be sent elsewhere for ginning, since these stations possess no factories.

The other stations that concern the trade of the taluka are Shahdadpur, Tando Adam and Tando Jam. Of these, Tando Adam is the nearest approach in the division, after Hyderabad, to the kind of town that may be considered to have a permanent and steady effect on the agricultural profits of a neighbouring deh. It has a population of 8,648, and therefore a considerable local consumption of grain, many well-to-do traders, 4 ginning factories and another in its suburb of Alahyar Mari, and also a railway station. On the other hand, it has a municipality with an octroi of 6 pies a maund on grain, which lessens its value as a market for local consumption. Most of the land nearest it in the Hala taluka is alienated, the nearest rayati dehs being Thora, Nindhero, Khorkhani, Kalri and Hakra. Of these, the first was a jagir deh and has lapsed to Government this year, and the remainder are in the 2nd class. I propose, for reasons given later, to raise them all to the 1st class, to some extent on account of their nearness to Tando Adam, but mainly because their other conditions justify this step. No other rayati deh in Hala is sufficiently near Tando Adam to require a change in its grouping. Dehs Ghaib Pir and Narli are the two nearest, and their trade goes quite as much

to Bhit Shah, Hala, and Ajan Shah on the west as to Tando Adam on the east. Shahdadpur is seven miles from the nearest land in Hala and, though a rising town with 3 ginning factories, is still small and without wealth. Little trade either in cotton or grain appears to go to it from Hala. Tando Jam possesses a population of 3,000 and 2 ginning factories, of which one has been closed all this year on account of the losses of its owner, but from enquiries made by me in that town it appears that it imports very little from the Hala taluka, with which it has no business connections.

(*b*) Prices are very even over the whole taluka. The reason for this is that the demand is exercised from a number of points in several directions. The ginning factories and grain dealers, when trade is brisk, buy from all over the taluka, even from parts that one would think must be under the monopoly of one factory or town, and the strain of competition from several points keeps the prices everywhere much the same. It is in this that I think must be found the explanation of the fact that there has been no increase in cultivation in the last 5 years of the settlement in any of the dehs nearest to stations on the Kotri-Rohri Railway which can be attributed to the opening of that line. The increases are all due to other causes (*vide* remarks in appendix XIII), and in some cases there has been a decline, though not of course on account of the railway. There is plenty of room for increase, and the land is cultivated to nothing like the extent that prevails in the Hyderabad taluka.

(*c*) The zamindars take no account of advantages in communications in fixing the rate of "lapo," or cash rent, they demand on cotton or other "mahsuli" crops, or on land leased out to their haris for one year. This is usually governed by such considerations as whether the land is on the bank of a Government canal or a private water-course, the nature of its soil and the neighbourhood of a village whence manure can be cheaply and easily obtained, but in no case that I have been able to discover by its distance from a market or centre of export.

I do not therefore propose any alteration in the existing grouping merely on account of the neighbourhood of the railway. Nor does there seem to me any other sound reason for changing its present principles.

Dehs possessing cotton ginning factories are no doubt in a better position than others, but no account was taken of this at the original grouping. The event has proved this policy right, since the closing of several factories through the uncertainty of the trade and the speculations of the owners would have often rendered such grouping unjustifiable. None of the factories in the taluka, except that at Ghotana, is in a natural position, and the continuance of none of them is certain.

After much consideration, I do not think that any changes should be made in the grouping in this taluka on account of water-supply. It is true that there are considerable differences between some of the canals, but these are mostly accidental and temporary, and almost all the canals can be made fully equal to their work without much expense or difficulty. Moreover, the existing boundaries of the dehs are so peculiar that to group many of them by canals would be impossible. For example, half of dehs Ahanjo and Chhachhri depend on the Great Marakh, at present the best, and half on the Small Marakh, at present the worst, canal in the taluka.

I propose to raise the following dehs in the west from the 2nd to the 1st class:—Kunar, Nurketi, Jamalabad, Bhanot, Old Hala, Jhirki and Kacho Khanot. They were originally placed in the 2nd class on account of the deterioration of their soil by floods and the "sour grasses and jungle" that had sprung up. Since that time, however, all the area that was exposed to floods and overgrown by jungle has been turned into Government forest after years of abandonment by the original owners, and the remaining rayati lands are exceedingly good. The kharif lands in these forest dehs are often cultivated every year because the owners allow professional graziers to station their cattle on them at night and thus secure an ample supply of manure free of cost. Moreover, the haris obtain cheap and natural grazing for their wheel bullocks instead of having to maintain them on oil-cake and cotton-seed as is necessary inland.

Deh Kunar now possesses only 21 rayati Numbers, which enjoy a good soil and an ample water-supply without any expenditure on clearance, as they are on the bank of the Gharo Rano. They are cultivated every year and are leased out at rates varying from Rs. 6 to Rs. 8 an acre. Lift cultivation has largely increased during the last 5 years.

There are only 40 rayati Numbers left in deh Nurketi which, in the last 10 years, have been cultivated on an average more than 6 times each. The soil is very fair, the supply from the Gharo Rano is ample as the level of the deh is low, and the lift cultivation has considerably increased during the last half of the settlement.

Jamalabad is mainly a sailabi deh, the land of which is irrigated by natural flooding without any expense to the cultivator, and produces every year fine crops of wheat and oil-seeds. Even in the late poor inundation, it received an ample wetting. The area of both lift and sailab cultivation has expanded considerably during the last 5 years.

The rayati land left in deh Bhanot, though much of it is sandy—or, rather, silty—in appearance, produces excellent crops, and the "lapo" taken by the zamindars on cotton is Rs. 10 an acre and their share of batai is one-third, the same rates as prevail in the neighbouring 1st class dehs. Being situated on the Gharo Bhanot and at the commencement of the Lakhi and Sarang wahs, it receives an ample water-supply, and its lift cultivation has largely increased during the last 5 years.

Old Hala, which is for the most part a sailab deh, produces every year the best crops of wheat and oil-seeds in the whole taluka, and the lands that grow these crops are leased out at very high rates (*vide* paragraph 20). Even after the late poor inundation, I saw excellent young crops springing up and not a foot of sailab land left uncultivated. The kharif lift lands of the deh are not so good in soil, being tinged with "kalar," but they have nothing to complain of in point of their water-supply from the Gharo Mahmudo, and there is no reason to continue the deh in the 2nd class on their account. In the last 5 years, there has been a small decline in sailab cultivation which has been more than compensated by a large increase in lift cultivation. Old Hala also possesses some good gardens.

Deh Jhirki has lost most of its rayati land by erosion and afforestation. The remainder of the kharif land consists of excellent soil which is watered from the Gharo Mahmudo and leased at high rates, and in which the annual average of cultivation has risen from *nil* in the first half to 62 acres in the second. The deh also possesses some good sailab lands in which there has been a satisfactory increase of cultivation, though accompanied by a decline in bosi cultivation, and some fine vegetable gardens.

Deh Kacho Khanot is a low-lying deh with an excellent soil and good kharif lift and rabi sailabi cultivation, in the former of which there has been an increase that more than compensates for some decline in the latter.

Cultivation in the remaining 2nd class dehs in the west of the taluka, *viz.*, Rishal, Kari, Nuralabad and Shorki, which are almost purely Government forests, is insignificant, and the lands themselves inferior. I do not therefore propose any change in their class.

Of the 2nd class dehs in the south-east of the taluka, I propose to raise Nindhero, Khorkhani, Kalri and Hakra to the 1st group. They were placed in the 2nd class with 9 other dehs by Colonel Anderson on account of a range of sand-hills which was alleged to pass through them. I have ridden through the length and breadth of them and saw no sand-hills at all in these 4 dehs. I do not think that sand-hills are in themselves a very serious drawback, and Colonel Anderson was not consistent in ignoring those near Bhit Shah and Khebar. The real disadvantages of the other 2nd class dehs in the south-east of the taluka, namely, Sadri, Bohriun, Sartanpur, Saidpur, Pawharki, Sohki, Dethki, Ganang and Keti, are not their sand-hills, but the poor and sandy nature of the soil, the highness of the lift even where out of the range of the dunes, and the sparsity of their population. The soil of the

first 4 dehs, however, is excellent. They are well populated and are near Tando Adam. Their drawback is that they depend to a great extent on the Kalian wah, a private canal belonging to Mir Sher Mahomed, the jagirdar of the neighbouring alienated dehs. This canal is a very fair one, and is at present well cleared by the enlightened lessee of the Mir's estate, but it may be neglected on the expiration of this lease, as is said to have been done in Mir Alahdad's time. On the other hand, (1) Mir Sher Mahomed is himself the largest zamindar in dehs Nindhero and Kalri, which lapsed in *choth* from his ancestors' jagir, and it is therefore in his own interest to clear the canal; (2) the zamindars get a clearance rebate of 6 annas in the case of lift and 4 annas in the case of flow cultivation; and (3) I trust the Public Works Department will take over the canal (*vide* paragraph 9).

Deh Nindhero is chiefly dependent on the Ali Bahar Tando Adam wah—a very fair Government canal forming the northern boundary of the deh. From this runs the kario Nindhero—a water-course that has been much neglected by its owner, the Mir. Khorkhani depends mainly on the Kalian wah in its eastern portion, but is watered to a certain extent on the west by a continuation of the kario Nindhero. Deh Kalri is irrigated in its northern half by the kario Kalri *ex* Ali Bahar Tando Adam—another much neglected karia of the Mir's—and in the south by the Kalian wah. Deh Hakra is wholly dependent on the Kalian wah, and is perhaps the best of the 4 dehs. The cultivation in it in the past kharif season was general and good.

Cultivation in dehs Nindhero and Kalri has declined considerably in the last half of the current settlement. The chief reason for this is the occurrence of what appear to have been abnormally high inundations in the years 1894-95 and 1897-98 which brought large areas in these dehs under sailab cultivation and swelled the average of the first 5 years. But a subsidiary cause, especially in deh Nindhero, seems to have been a quarrel between the Mir and his haris, who, according to the lessee of the Mir's estate, claim to be the rightful zamindars and carry off all the produce. Consequently, the Mir neglects this part of his land. The quarrel will, I suppose, settle itself some day, and meanwhile it affords no reason to defer the raising of these dehs to the class in which their natural advantages obviously place them. In Hakra, there has been a small, and in Khorkhani a satisfactory, increase of lift cultivation, but the total cultivation of the latter deh shows a falling-off in the last 5 years, due to a decline in sailab cultivation under the circumstances mentioned above.

I do not propose to raise any of the remaining 2nd class dehs in the south-east to the 1st group. As remarked above, they suffer from an unfertile, sandy soil, a high lift and a small population—disadvantages which more than counterbalance their proximity to the stations of Alahdino Sand and Udero Lal, and there is so much unoccupied and uncultivated land in them that it would in my opinion be not only unfair but probably also unprofitable to raise their assessment at the risk of discouraging extension of cultivation. There has been very little increase, and in most cases a decline, of cultivation in them during the last 5 years of the settlement, but applications for new land are now beginning to come in.

I propose to lower deh Khanot from the 1st to the 2nd class. Much of the deh is blank *kalar*, and there is hardly any land in it free from salt. *Kalar* may be a matter of indifference in rice lands under flow, but is very serious for millets and cotton under lift when it does not merely lie on the surface, as it is impossible to wash out. Appendix XIII shows that the average annual area of actual cultivation has declined from 959 acres in the first half to 645 acres in the last half, and in the last year the area cultivated was 533 acres. A little of this decline has been in sailab, but the greater part has been in kharif lift, to account for which I know of nothing, except increasing *kalar*. Its water-supply in the south from the Gharo Mahmudo and Sangro is good, but the crops I saw in that portion in the past season were very sparse and indifferent. Further north, on karias from the Ali Ganj, where the soil is sweeter, I found better cultivation, but the deh has a melancholy appearance on the whole, and I do not think that its proximity to New Hala and the Ghotana ferry compensates for the badness of its soil. In addition, the level of its lift is high.

The following dehs are to be classed, in some cases formally, for the first time—Giss, Thora, Khebrani, Litniun, Palejani, Jakhri, Visro and Mubarak wah.

Deh Giss was transferred from Shahdadpur to Hala in 1903-1904. In the former taluka, it was in the 1st group, the lift rate of which is Rs. 2-12, or the same as that of the 1st group in Hala. Since its transfer to Hala, it has been treated as in the 1st class, in which I propose it should be finally placed. It is true that most of it suffers from deficiency in the Small Marakh, Opan, Paru and Awat wahs, and that there has been a serious decline in flow and sailab cultivation during the last half of the settlement, but these canals will, I hope, be shortly improved, and that part of the deh which is on the Great Marakh could not have a better supply.

Deh Thora was an alienated deh which has lapsed to Government from the current year on the death of the jagirdar, Mir Jam. Its conditions are much the same as those of the neighbouring dehs of Kalri, Khorkhani, Hakra and Nindhero, and like the first three it is dependent on the Kalian wah. Its soil is good, it lies near Tando Adam, and I found the past kharif cultivation in it very fair in spite of the poor inundation. I recommend that it should be placed in the 1st class with its 4 neighbours.

Khebrani, Litniun, Palejani, Jakhri, Visro and Mubarak wah are almost entirely alienated dehs, containing small rayati areas, which were in existence at the commencement of the current settlement, but were by some mistake not classified. The very small rayati cultivation in the first 3 dehs has, however, been paying 1st class rates. Of these, I propose that the rayati lands in dehs Khebrani and Litniun should be formally placed in the 1st group, in which these 2 fine dehs would certainly be, if they were not alienated. The rayati portion of deh Palejani is mostly a mass of sand-hills and poor sandy land. It deserves to be placed in the 2nd class like the neighbouring rayati dehs, and it is possible that this may encourage further cultivation in it. There has been no cultivation during the current settlement in the rayati portions of Jakhri, Visro, and Mubarak wah, except a little barani cultivation in the 2 latter dehs. The rayati land in Jakhri consists almost entirely of uncultivable sand-hills. Some of the rayati land in Visro has now been taken up, and applications are being made in Mubarak wah. In neither case is the land good—the absence of cultivation is sufficient proof; and I recommend that the rayati areas in dehs Visro and Mubarak wah and in deh Jakhri be classed in the 2nd group like the neighbouring rayati dehs.

The alienated portions of the jagir dehs Kubiki, Charao and Khudi have been surrendered by the jagirdar for public works, such as railways. The remainder of the land in these dehs is wholly alienated, and it is not therefore necessary to class them.

24. *Rates.*—The all-important rate in this taluka is that of kharif lift. In paragraph 37 of his report in 1894, Mr. Seymour, while deprecating any increase at that time in the rates, wrote "In fact, the level of the present rates is so high that, even with an advance in material prosperity and with increased water-supply, any future enhancement can be but slight;" and Sir Evan James in his forwarding letter said "I quite agree that Rs. 2-12 is sufficient for kharif wheel, mainly because the lift itself is high and Rs. 2-12 is a high rate for wheel, as rates go in Sind. I have always felt, indeed, that wheel rates generally in Sind are, if anything, somewhat too high compared with other modes of irrigation." In the same letter, Sir Evan James referred to probable improvements in the taluka by irrigation schemes then before Government, *e. g.*, the Ren and Ali Bahar Kacheri, and the Gharo Mahmudo, by the Jamrao taking over some of the cultivaton in the tails of canals in the east, and by the Kotri-Rohri Railway. Of these, the Kotri-Rohri Railway has been constructed, but nothing has been done to carry out the Gharo Mahmudo and Ren-Ali Bahar Kacheri wah schemes, and the Jamrao has, it is true, taken over a little cultivation on the tails of some branches of the Great Marakh and Ali Bahar Kacheri in the Shahdadpur taluka (though by abruptly closing them it is doubtful whether the eventual harm will not be greater than the

present good), but this has had absolutely no effect on the Hala taluka. Even had the Gharo Mahmudo and Ali Bahar-Ren wah schemes been carried out, they would hardly have justified any increase of assessment in Hala, as the object of the first scheme is to improve the supply and extend cultivation in the Tando Alahyar taluka, and, as the Executive Engineer says, would be of little advantage to Hala, and the second scheme would only give a fair supply of water to a deficient canal. There have, however, been no improvements to speak of in irrigation. In communications, there have been the important changes effected by the Kotri-Rohri Railway, and in the average of prices during the settlement there has been an all-round rise. The question is whether there should be any enhancement of the lift rate. I would invite attention to the following facts :—

(1) The average rates per acre for which 17,991 acres 10 guntas have been sold during the current settlement has been only Rs. 13-10-10 against an average assessment of Rs. 2-10-0, and the average rate per acre for which 50,445 acres have been mortgaged in the same period has been Rs. 4-12-10 against an average assessment of Rs. 2-11-6. It seems to me that amidst a mass of figures these of registered sales extending over a number of years are valuable indications of condition and progress, and, in commenting on them in paragraph 19, I have shown reason for believing that they fairly represent the market value. During the previous settlement, 43,883 acres were sold and 106,858 acres were mortgaged at average rates of Rs. 5-4-6 and Rs. 2-2-5 per acre, respectively, and the large amount of land sold and mortgaged and the low rate fetched certainly appear to me to show that the assessment was too high. The satisfactory improvement in the present settlement is no doubt due to better communications and prices, especially of cotton, but even now the value of land cannot be called high. It is nothing like what it appears to be in Upper Sind.

(2) The general level of land in the taluka is exceptionally high.

(3) The absence of good natural grazing, except in the Government forests, makes the up-keep of wheel cattle very expensive.

(4) There is practically no dubari cultivation, and the cultivators depend on one crop.

(5) The soil, if not manured, requires three or four years' rest between each crop.

(6) While the price of uncleaned cotton has risen greatly, that of the main staple—bajri,—which occupies 61 per cent. of the cultivated area, has been more or less stationary, and, during the last 4 years, its average has been the same as it was in the previous settlement.

On these considerations, I do not think there is any reason to raise the existing kharif lift rates of Rs. 2-12-0 and Rs. 2-8-0. As far as I can judge, they now form an equitable tax, under which the value of land is rising, while its transferrence to money-lenders is being checked, more wells are being dug, and the zamindars are contented, while as prosperous as their habits will permit them to be.

In view of the rise in the price of cotton, the high rent that zamindars get on it, and the fact that it takes much more water than bajri, it was at first my intention to propose a special cotton rate (on the same principle as a garden rate) of 4 annas an acre over the ordinary lift assessment on Numbers cultivated in any part with cotton. After much consideration, however, I have come to the conclusion that such a tax is inadvisable as it would have a very unequal incidence. It is extremely rare in this taluka to find a whole Number cultivated with cotton. As a rule, not more than a couple of acres, and often only a few guntas, out of a Number, the average size of which is according to paragraph 4 of Mr. Seymour's report 6½ acres, will be found cultivated with cotton, partly because the hari cannot afford the expense of growing more, and partly because he must lay up a stock of bajri straw for his cattle during the year. The incidence of the tax will then vary greatly,

according to the area of the Number and the extent it is cultivated with cotton. If all the Numbers were of one small uniform size, of, say, 1 acre, I should recommend such a rate as the best means of automatically adapting the assessment to the marked rise in the value of cotton, without touching the profits of bajri, and of fairly charging for the water it takes in excess of that required by the latter crop. But the illogical sizes and shapes of the existing Numbers are serious obstacles, and, as I have pointed out in paragraph 17, there is at present a sort of natural compensation between low-lying lands, where the lift is cheap but the soil is hard and cannot grow cotton successfully, and high lands, where the lift is costly but the best cotton is grown.

In the other rates, however, I propose some changes as shown in the following table. Rates for cultivation on river kacha lands are given and dealt with separately in paragraph 28 :—

	Existing rates per acre.		Proposed rates per acre.	
	1st group.	2nd group.	1st group.	2nd group.
	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Kharif.				
Gardens	4 0	4 0	4 4	4 0
Rice under flow	3 8	3 4	3 8	3 4
Other flow	3 0	2 12	3 4	3 0
Lift	2 12	2 8	2 12	2 8
Lift aided by flow	3 0	2 12	3 0	2 12
Rabi.				
Huris	1 4	1 2	1 4	1 2
Bosi	2 12	2 8	2 12	2 8
Bosi aided by lift	3 4	3 0	3 4	3 0
Sailab	3 0	2 12	3 4	3 0
Sailab aided by lift	3 8	3 4	3 12	3 8
Lift	3 8	3 4	3 8	3 4
Barani.				
Kharif	1 8		1 8	
Rabi	2 8		2 8	

The following are my reasons for the proposed changes :—

Gardens.—The rayati gardens of the taluka are practically confined to the neighbourhoods of New and Old Hala, Khandu, Sekhat, Matiari and Shahpur. They supply not only the rest of the taluka but the whole of Shahdadpur and part of Tando Alahyar, where vegetables are very scarce. For the most part, they are very fine and valuable, and considering the extent of the market they command and the demand for their produce, their present assessment is low and should certainly in my opinion be raised another 4 annas. The rate in the 2nd group, where they are almost unknown, may be left as it is.

Other flow.—At present, there is a difference of 4 annas between "lift" and "lift aided by flow," but none between the latter mode of irrigation and "other flow," though there can be no question that there is a considerable difference in the cost of cultivation, and a distinction in assessment is now made in many talukas. I propose that the assessment of "other flow" should be 4 annas higher than that of "lift aided by flow," and I have no doubt the zamindars will take the difference from the haris. In some cases, they

already take a larger share of "batai" and more "lapo" on flow than on lift cultivation, but where they do not, the reason is that the area of flow cultivation is so small that they do not trouble about it.

Sailab.—The present bosi rates are the same as those of kharif lift with an increase of 8 annas if the crop receives a cold weather lift supply, which greatly increases the out-turn. The rates I propose for simple sailab are the same as those I propose for "kharif other flow," with an enhancement of 8 annas, as before, when the crop is aided by lift in the cold weather. The distinction between bosi and sailab should in my opinion be the same as that between kharif lift and flow. It is true that "bosi" cultivation is not always as costly as kharif lift, since the land is sometimes prepared by flow irrigation in the kharif season, but in Hala it is usually wetted by lift. Sailab cultivation, on the other hand, is one of the easiest and least expensive modes of cultivation. It is mostly found along the river edge, where the lands, which received an ample wetting even in the late inundation, are cultivated every year with fine crops of wheat and oil-seeds without the application of any manure and without any expenditure on clearance or maintenance of water-courses. The high rates of "lapo" received by the owners of sailab lands near Old Hala have been shown in paragraph 20.

25. The financial results of the proposed rates in the surveyed lands of the taluka, excluding deh Thora, on the average of the last 5 years' cultivation, are given in appendix XVI. The gross assessment expected is Rs. 1,45,027, from which Rs. 7,194, being the difference on account of rebates for the clearance of private karias between the average gross and net assessment in the last 5 years, must be deducted to arrive at an average net jamabandi on cultivation alone of Rs. 1,37,833.

26. This gives an increase when compared with the average net jamabandi (Rs. 1,35,928) in the last 5 years of the current settlement of Rs. 1,905 or 1·40 per cent., made up principally under the following heads:—Sailabi, Rs. 838; kharif lift, Rs. 421; gardens, Rs. 388; and "other flow," Rs. 130. The greatest increase is naturally in the 2nd class dehs containing considerable sailabi cultivation that are now raised to the 1st class, since the combined changes in rates and grouping raise the assessment on such lands in these dehs by 8 annas an acre. The highest percentages of increase are 13·76 in Jamalabad and 13·28 in Old Hala, which is not in my opinion at all excessive, considering the advantages these dehs enjoy.

27. I have no remarks to make on the comparison in appendix XVI of the average assessment, under each head of irrigation, with the average rates under the current settlement.

28. Figures for deh Thora are not included in any of the regular appendices, as the deh has only lapsed from jagir from the current year. I have prepared a supplementary appendix (No. XVI-A), showing in round figures the assessment expected in it on the average of the past 5 years' cultivation. This amounts to Rs. 2,440, from which about Rs. 390 must be deducted on account of rebate for clearance, if the Kalian wah is not taken over by the Public Works Department. Comparison with the revenue paid by the deh when it was alienated is not necessary.

29. The only unsurveyed lands in the taluka are the riverain kachas, and the existing rates per acre are as follow:—

	Rs.	a.
Lands sown with kharif and peshras crops ...	3	0
Lands sown with rabi wheat and barley ...	3	0
Lands ploughed and sown with other crops ...	2	8
Lands unploughed	1	8
Lands sown with simko	0	8

Many of these rates are perfect puzzles to me, and have evidently been found so by others and disregarded at jamabandi, as the details of columns 4 and 6 in appendix XVII show. Land sown with wheat and barley has been rightly assessed at Rs. 3 and unploughed land at Rs. 1-8, but while lands "ploughed and sown with other crops" have been charged the correct rate of Rs. 2-8 in Khandu and Richal, they have been charged the sailabi rate of the 2nd group (Rs. 2-12-0) in deh Kacho Khanot. In dehs Khandu, Porath and Kacho Khanot, kharif cultivation has been assessed at the irrigational rates fixed for surveyed lands, *viz.*, kharif lift Rs. 2-12-0 and Rs. 2-8-0, and garden Rs. 4, whereas they should apparently have borne one uniform rate of Rs. 3, whatever the crop or mode of irrigation. In Khandu, again, a small area of "peshras" cultivation (a word unknown in these parts, but which I believe to mean the spring "adhaon" crops) has been charged the rate of Rs. 3-8-0 for "sailab aided by lift" in the 1st group, instead of Rs. 3, and in the same deh other sailabi cultivation in rabi aided by lift has been charged Rs. 3-8-0 instead of Rs. 3 or Rs. 2-8, according as it was cultivated with wheat, barley or "other crops."

Apart, however, from the tapadar's difficulties in understanding these rates, their application may lead to some strange results. (1) There being no separate garden rate for kacha lands, land sown with melons (an extremely paying "garden" crop) in kharif would pay Rs. 3, as against Rs. 4 in surveyed areas, and in rabi would pay Rs. 2-8, as it must be classed with "other crops." (2) While kharif lift on kacha lands even in a 2nd class deh pays Rs. 3, or 4 annas more than the rate in 1st class surveyed dehs, rabi sailabi jambho pays Rs. 2-8 or 4 annas less than the rate even of 2nd class dehs, and, if aided by lift in the cold weather, still pays the same rate, while in surveyed lands it would be charged an extra 8 annas. (3) If "other crops" (*e.g.*, jambho) are sown on unploughed land, they are assessed Rs. 1-8, but if wheat is sown on unploughed land, as I have seen done in deh Jamalabad in kacha, though surveyed, land, it must (apparently) pay Rs. 3, as it is not laid down whether the "land sown with wheat and barley" is to be ploughed or not.

It is true that very kacha land cannot be ploughed. The cultivator can only broad-cast the seed, which springs up and flourishes in the cracks that form in the land as it dries in the sun, but is poor, if it grows at all, on the surface, and the out-turn per acre is consequently much less than it would be if the land had been ploughed and the crop evenly distributed over the field. Such land may therefore be rightly assessed at low rates, though it is a question whether the reduction of the cost of cultivation to almost *nil* does not make up for the smaller out-turn and whether a rate of Rs. 1-8 is not setting a premium on laziness. But as this rate is the same for unploughed kacha lands all over Sind, I do not propose any alteration. I cannot, however, see any valid reason for distinguishing between kacha lands that are sufficiently paka to be ploughed and paka surveyed lands, or for making a difference, that is unknown in surveyed areas, between the assessment of wheat or barley and jambho or other crops. Further, the kacha lands in Khandu and Kacho Khanot were surveyed in the year 1902-1903 and are now assessed like the remaining surveyed portions of these dehs. Practically, therefore, cultivation on kacha unsurveyed land is now confined to a trifling area in deh Amin Lakho, where the land seems to have been sown hitherto without ploughing, though I saw some ploughed areas there this year. No "simko" is ever grown in this taluka. I therefore propose to retain only the rate of Rs. 1-8 for rabi cultivation on unploughed kacha lands, whether of wheat, barley, jambho, matar, or any other crop, and to assess all other cultivation on kacha lands at the irrigational rates sanctioned for the dehs in which they lie. The resulting revenue on the basis of the average of the past 5 years will be Rs. 406-14-0, or an increase of Rs. 17-12-0 over the previous collections. For the purposes of comparison in appendix XVII, I have had to treat the kacha lands in Khandu and Kacho Khanot as though they were still unsurveyed.

30. The general financial results expected from the proposed settlement in surveyed and unsurveyed land together on the basis of cultivation in the

last 5 years under review are as follow :—

	Area.	Present settlement.	Proposed settlement.	Increase.	Increase per cent.
	A.	Rs.	Rs.	Rs.	
Surveyed land ...	52,463	1,43,122	1,45,027	1,905	1·33
Deduct on account of rebate for clearance.	...	7,194	7,194	...	...
Remainder	52,463	1,35,928	1,37,833	1,905	1·40
Unsurveyed land ...	172	389	407	18	4·62
Dubari cultivation ...	897	614	614	...	...
TOTAL ...	53,532	1,36,931	1,38,854	1,923	1·40
Deh Thora	1,035	...	2,848	2,848	...
GRAND TOTAL ...	54,567	1,36,931	1,41,702	4,771	...

31. I have directed the Mukhtiarkar to publish the proposed rates and grouping. As the current settlement has been guaranteed up to the 31st July 1906 by Government Resolution No. 7841, dated the 10th November 1903, I recommend the introduction of the new settlement from the 1st August 1906. I had intended to recommend that it should be fixed for a period of 20 years as the conditions of the taluka have changed so little in the past, and important changes in the future in irrigation, or in communications now that the Kotri-Rohri Railway has been built, seemed to me improbable. But the Superintending Engineer, Indus Left Bank Division, has lately mooted a scheme for a feeder to the canals in the Hyderabad district to be taken off from the Indus in the Rohri taluka, which would, it is believed, give a perennial flow supply to most of the land in the Hala division. If there is any chance of this scheme being carried out, it would be better not to guarantee the settlement of this taluka for more than 10 years, as it would entirely change the existing conditions.

I regret the delay in the submission of this report, which is due to the fact that I could not get appendices XIII and XIV-A corrected till the middle of March, and accurate figures of the previous and current settlement in paragraphs 11 and 12 till the end of that month.

I have the honour to be,

Sir,

Your most obedient servant,

E. L. MOYSEY,

Assistant Collector,

Hala.

Through the Collector of Hyderabad.

* The greater part of the deh was jagir before 1900-1901, from which year it became rayati.

† Increase of cultivation due to the lapse to Government of jagirs in 1899-1900 and 1902-1903.

E. L. MOYSEY,
Assistant Collector, Hala.

APPENDIX XXI.

No. 7089 of 1904.

Executive Engineer's office,

Camp Alahdino Sand, 19th November 1904.

From

THE EXECUTIVE ENGINEER,
Central Hyderabad Canals,

To

THE ASSISTANT COLLECTOR,
Hala.

Sir,

With reference to your No. 1423 of the 19th September 1904, I have the honour to give below my views as regards irrigation by canals in the Hala taluka.

1. The following are the principal canals in Hala taluka :—

1. Ali Bahar Kacheri.
2. Great Marakh.
3. Gharo Rano.
4. Gharo Bhanot.
5. Gharo Mahmudo.
6. Ghalu.
7. Nasir.
8. Sarfraz.
9. Nur.

The detail of branches of the above canals in Hala taluka is given below :—

Ali Bahar Kacheri.

Sobho Chakar.

Great Marakh.

Jam wah Pingharo.

Lohano.

Gharo Rano.

Gharo Gahot.

Marakh, Small.

Paru wah.

Awat wah.

Opau wah.

Malko Vanjheri.

Lakhi.

Gharo Bhanot.

Ali Gunj.

Gharo Mahmudo.

Sangro.

Ali Bahar Tando Adam.

Ghalu.

Khalkah.

Bhumphar.

Nasir.

Khair.

Gun.

Sujawal.

Sarfraz.

Bhaurko.

Ali Bahar Kacheri.—This canal is fed from the Nakur dhand, which in its turn gets its supply from the river through the Gharo Ali Bahar Kacheri. As the dhand used to fill late, a new cut was made in 1899-1900 from the Great Marakh dhand to give it an early supply. This improved matters a little, but still there were complaints of deficiency of water. This year, however, on account of the erosion of the Great Marakh dhand, the supply to the Ali Bahar Kacheri is very much improved, as the new cut above referred to takes off direct from the river.

Great Marakh.—This canal takes off from the river Indus and has worked most satisfactorily. The dhand at its head got silted at both ends in 1900, consequently a channel had to be cut to the river to provide early water to the dhand. On account of a change in the river's course last year, the dhand in question was eroded, and is no more in existence, and so the canal has now a direct source from the river, and consequently gets an ample supply.

Gharo Rano.—The canal has worked well during the current settlement, but in 1903 on account of erosion at its head it was silted up, and therefore ceased flowing early. To remedy this, a new mouth has been given to it last year at a cost of Rs. 2,670, which worked well in the last abkalani season.

Gharo Bhanot.—This Gharo, with its branches, has worked satisfactorily during the settlement under report.

Gharo Mahmudo.—Owing to erosion at its head in 1898, it got silted up very badly and so did not receive a fair supply. However, to improve matters, a new mouth from a dhand *ex* river Indus, about $1\frac{1}{2}$ miles in length, was given at a cost of Rs. 6,532 in 1899. The width of the new cut was kept only 20 feet, to see how it worked, and as it worked well it was subsequently further widened to 40 feet in 1903 at a cost of about Rs. 4,000. The Ghara now carries sufficient water for the cultivation dependent on it. To canalise and improve the supply in this Gharo, and to augment the supply in the Ghalu wah, a project amounting to Rs. 2,55,000 has been sent to the Superintending Engineer, Indus Left Bank Division.

Ghalu.—It gets its supply by two sources—one by a cut made by zamindars in 1893 from the river Indus, and which was subsequently widened in 1895, and the other from the Gharo Mahmudo, which tails into it. This canal has worked well during the settlement under report.

Nasir.—This canal takes off direct from the river Indus and has worked well, and no improvements were carried out to it during the settlement under report.

Sarfraz.—This canal takes off from the river, and has carried a sufficient supply during the last 10 years, but on account of its being heavily silted up at its head it used to cease flowing early. To remedy this, its old mouth was cleared in the last abkalani season. It went on flowing after the present mouth had stopped flowing, and so it has been proposed to put a bund across the canal just below the head of the Bhaurko wah, and to leave the mouth, cleared last year, open for feeding the Sarfraz wah. The present mouth will feed the Bhaurko wah and serve the Jakhri and Matari forests. The supply in the Bhaurko will thus be greatly improved.

Nur wah.—This canal is not an important one, and takes off direct from the river Indus and tails into the Great Marakh. It was only about 42 *takis* in length, but on account of the erosion in 1898 at its head, a portion of it was washed away. It was therefore closed in consultation with the Collector of Hyderabad, and arrangement was made to irrigate the land dependent on it from the Great Marakh. But in 1901-02 after the erosion had stopped, it was re-opened on the representation of zamindars and with the approval of the Collector. There was a slight erosion at its head again last year, and a very small portion of it was eroded.

A statement showing the expenditure on the canals for the last 10 years is herewith sent.

As regards the map you require, I beg to inform you that the information you require is not available in this office. An estimate has been sent to the Superintending Engineer, providing for the collection of that sort of information that you require. When the information is collected, a map can be prepared, showing how much land is under flow and how much under lift irrigation, how much is occupied and how much is lying waste, &c.

I have, &c.,

(Signed) V. T. AGASHE,
Executive Engineer,
Central Hyderabad Canals.

No. 7425 of 1894.

Executive Engineer's office,

Sakrand, 3rd December 1904.

From

THE EXECUTIVE ENGINEER,
Central Hyderabad Canals,

THE ASSISTANT COLLECTOR,
Hala.

SIR,

With reference to your No. 1798 of the 23rd instant, I have the honour to furnish herewith further details, as desired—

(*a*) Rs. 480 were spent on cutting the new channel to the Ali Bahar Kacheri from the Great Marakh dhand in 1899-1900.

(*b*) About Rs. 1,800 were spent in 1900 on cutting a channel to feed the Great Marakh dhand.

(*c*) The direct supply channel from the Indus to the Ghalu wah is now under the management of the Public Works Department. The cost of widening this channel is not known, as the work was done from the ordinary clearance grant before the creation of this district.

2. The Gharo Mahmudo project, mentioned in the settlement report of Hala taluka in 1894, was subsequently revised, and the undermentioned works have been provided in the revised project:—

(1) Constructing a bund from the junction of the new head of the Gharo Mahmudo to the kacha-paka boundary.

(2) Widening the Gharo Mahmudo and the head of the Ghalu up to the bridge on the Hala-Matiari road.

(3) Raising the banks of the Gharo Mahmudo and the head of the Ghalu wah up to the bridge on the Hala-Matiari road.

(4) Embanking the left bank of the Nasir wah with a view to prevent the flooding of Richal dhand. None of the abovementioned items, with the exception of No. 4, will do any material good to the Hala taluka. The abovementioned project was submitted to the Superintending Engineer with this office No. 3827 of the 26th December 1902, and it was hoped that it would, when carried out, improve the supply of water in the Sangro, Ali Bahar, Tando Adam and Ghalu wahs. However, on seeing the dhand at the mouth of the Gharo Mahmudo this week, I doubt whether the dhand will continue to be as favourable as it has been for the last 4 or 5 years. It is noticed that it has silted up considerably during the last abkalani season, and if it continues doing so the project will have to be all changed.

3. The silted bed of the Bhaurko wah is about 4 feet higher than the silted bed of the Sarfraz wah, and so if a little silting occurs in the Sarfraz wah it would not affect the Bhaurko wah discharge, which is likely to improve on account of the larger head that would now be available.

4. No further improvements are at present proposed beyond those mentioned in this office No. 7989 of the 19th November 1904.

I have, &c.,

(Signed) V. T. AGASHE,
Executive Engineer,
Central Hyderabad Canals.

No. 7815 of 1904.

Executive Engineer's office,

Camp Tando Alahyar, 23rd December 1904.

From

THE EXECUTIVE ENGINEER,
Central Hyderabad Canals,

To

THE ASSISTANT COLLECTOR,
Hala.

Sir,

With reference to your No. 1920 of the 5th instant, I have the honour to inform you that there are only the two undermentioned bunds in Hala taluka which are maintained by the Public Works Department:—

(1) *Bund called Ghalu Ali Bahar Bund.*—This bund was constructed to check the river spill between the Ali Bahar Tando Adam canal and the jagirdari canal Sher wah. The work was commenced in October 1894, and completed in June 1895 at a cost of Rs. 8,941.

The total length of the bund is 5 miles and 2 furlongs.

No expenditure has been incurred on this bund during the last few years.

(2) *Nakur Bund.*—This bund was commenced in 1885, and the whole bund, 10,400 feet in length, was made continuous in about 4 years, from the head of the Great Marakh to the head of the Gharo Rano. It was maintained till the year 1894. In the year 1895, the bund was eroded for the first time, and 1,200 feet of its length carried away. Erosion continued for 3 years, *i. e.*, till the year 1897, and the remaining bund measured 2,688 feet. The remaining portion of the bund has been cut away in 1903 and 1904, and it is now proposed to put in a new bund altogether at a distance from the present bank of the river.

I have, &c.,

(Signed) V. T. AGASHE, L.C.E.,
Executive Engineer,
Central Hyderabad Canals.

STATEMENT showing EXPENDITURE on clearance of canals of Hala taluka during the last 10 years.

V. T. AGASHE, L.C.E.,
Executive Engineer,
Central Hyderabad Canals.

No. 6464 OF 1905.

REVENUE DEPARTMENT.

Collector's office,

Hyderabad, 16th September 1905.

From

H. C. MULES, ESQUIRE,
Collector of Hyderabad,

To

W. T. MORISON, ESQUIRE, I.C.S.,
Commissioner in Sind.

Sir,

I have the honour to submit the report of Mr. E. L. Moysey, I.C.S., Assistant Collector, Hala, on the proposed revision settlement of the Hala taluka and the marginally noted papers.

1. Extract paragraph 9 of Assistant Collector of Hala's No. 1466 of the 16th September 1905.
2. Letter No. 2620 of the 10th June 1905 from the Superintending Engineer, Indus Left Bank.
3. Two petitions of objections.
4. Letter No. 1148 of the 13th July 1905 from the Assistant Collector, Hala.
5. Statement of differences.

2. Mr. Moysey has described the former and existing conditions in detail. I concur with his remarks generally, and do not propose to descant thereon myself, but only to notice points in the report which seem to call for remark.

3. *Paragraph* 2.—It is not quite right to say that wholly jagir dehs are not concerned with the settlement. It is necessary for the purpose of calculating cesses that such dehs should be grouped, and this has now been done, *vide* extract paragraph 9 of Assistant Collector, Hala's No. 1466 of the 16th September 1905, which is attached.

4. *Paragraph* 3.—The increase in male population is 3,474 not 3,374, as given.

5. *Paragraph* 4.—The figures are unreliable. The instructions contained in your No. 3444 of the 16th December 1902 as to the preparation of village form XIII afresh prior to the introduction of a revised settlement have been neglected.

6. *Paragraph* 9.—(*A*) Mr. Moysey is very well acquainted with his canals, as I know quite apart from this report.

I have only to observe that they are all inundation canals and, running through a "lift" country, are difficult to keep in order, and the waste of time and labour is enormous.

If the enlarged scheme put forward by Dr. Summers for a supply channel from Rohri is ever carried out, the conditions of cultivation will undergo a change in this and other talukas.

The taluka like others in this district is remarkable for the number of quite insignificant canals in the hands of Government. This is due to the fact that the numerous owners have no powers of combination, but are always ready to squabble and cheat each other as much as possible.

(*B*) *Clearance allowance.*—This is a very difficult matter, and it certainly cannot be said that it is at present treated in an altogether satisfactory manner. The whole question is now under consideration on a reference from you. It has not, however, to be considered particularly in connection with the revision settlement of a single taluka.

7. *Paragraph* 11.—Mr. Moysey, at the end of this paragraph, gives reasons for stating the figures in Mr. Seymour's report to be misleading, and certainly for purposes of comparison the system he has adopted appears preferable.

8. *Paragraph* 12.—The last year of the current settlement shows a larger area of cultivation than in any year of the 30 under review, except 1897-98. But this, it has to be remembered, was coincident with a highest-on-record inundation, and so it would be quite unsafe to make any particular deductions from the figures.

Taking into consideration the facts (i) that the population has increased by 6863, (ii) that no radical improvements in irrigation have been effected, (iii) that the struggle for existence becomes more severe yearly, and (iv) the great demand for cultivable land throughout the province, it does not appear to me that the figures given by Mr. Moysey show there has been any marked advance in the condition of the taluka since 1894-95, if indeed there has been any beyond that inevitable under the conditions prevailing.

9.—*Paragraph* 17.—Sir E. James was probably thinking of the cotton grown at Bhit Shah when he said the Hala cotton was the finest in Sind. This Bhit Shah cotton enjoys a considerable reputation, and more care is taken about it than about other indigenous cotton.

Mr. Moysey observes here that "In kharif, the land is not usually ploughed till water enters the canals and is raised to moisten it." This requires the addition that land can hardly be ploughed until the water enters the canals, seeing that in the rainless climate of Sind land once cultivated as a rule dries stony hard, and, if not impervious to the plough, can only be ploughed with such an expenditure of labour as puts the operation out of the question. I notice this because it is one of the difficulties the Sindhi land-owner has to contend with, and I have known an Executive Engineer of the Public Works Department complain of the laziness of the people who will not get their lands ready to take the water for cultivation as soon as the canals are open. As regards rotation of crops, there is no doubt that cotton, bajri and juari (spiked and great millet) are most exhaustive of the soil, and light lands soon require a long fallow when these are grown, unless artificial nourishment is applied freely. I do not place much reliance on the crop experiment by Mr. Pringle mentioned by Mr. Moysey, and consider it may be altogether discarded. I happen to be aware that he selected an exceptionally remarkable crop. Isolated crop experiments are always misleading, and in this case we have no others to go by except that which Mr. Moysey himself conducted on a good crop. But how often are the crops not only not good but very bad?

10. *Paragraph* 18.—If the year 1899-1900 be discarded in striking the average price of bajri, a year of great scarcity in which poor-houses were opened in other parts of the province, the average works out at exactly the same as during the last year of the former settlement, *viz.*, Rs. 2 per maund.

11. *Paragraph* 20.—The figures show that land even now does not sell at a high price—an average of less than Rs. 14 per acre .is distinctly low. It is, however, much higher than when the settlement was introduced. The chief reason for the rise is to be found in the earth hunger which of late years has affected all classes of the population. To this, and not to improved irrigation or communications, do I chiefly ascribe the increase in land values, which, however, has not brought their market price to within measurable distance of that obtained in Upper Sind.

12. *Paragraph* 22.—The figures of notices and arrears given by Mr. Moysey are in some cases incorrect. The correct figures I give below :—

Year.	No. of notices.	Amount.
1894-95	397	15,056
1895-96	403	11,568
1896-97	465	17,551
1897-98	836	54,016
1898-99	1065	39,313
1899-1900	1023	31,960
1900-01	1161	40,431
1901-02	781	32,755
1902-03	925	38,570
1903-04	943	45,220

13. *Grouping.*—Mr. Moysey's proposals appear to me acceptable. His remarks show that he has carefully considered the conditions existing, and indicate a thorough knowledge of the localities concerned, gained by personal inspection. I do not therefore consider it necessary to enlarge upon this point, and will only observe that, if sand-hills existed in certain dehs in Colonel Anderson's time, they have disappeared now, as they evidently are not visible at the present time.

14. *Rates.*—As Mr. Moysey observes, the all-important rate in this taluka is that of "kharif lift." This represents 79 per cent. of the cultivated area and 78 per cent. of the assessment.

The areas under the various modes of irrigation I give here for ready reference.—

Lift	... 42,181
Lift aided by flow... ...	... 1,425
Flow	... 502
Rice	... 70
Garden	... 1,951

I entirely concur with the remarks in the report as to the lift and lift aided rates, and consider it fully demonstrated that they cannot equitably be raised, and also that there is no reason for reducing them. I am not in accord with Mr. Moysey as to the "flow" rates proposed by him. I do not see that there is any necessity to differentiate merely for the sake of so doing between these and lift aided by flow rates.

They exist at the same figure in many talukas in this and other districts. The area under other flow is altogether insignificant. The crops raised, though less expensively raised, are no better than those on aided lands, and generally speaking not so good. The increase in revenue will in no way compensate for the discontent caused.

As regards garden and rice rates, these should be, in accordance with accepted principles, the same. The gardens of Hala may command a better market than those of Naushahro and Kandiaro, which are at present assessed at the same rate. The proposal of Mr. Cole to increase these rates to Rs. 4-8-0 for the 1st group was negatived by Mr. Giles, when Commissioner, in view of the impossibility of assessing rice similarly. The gardens are shown by Mr. Moysey to have excellent markets and to produce good crops, and I am unable to suppose that they cannot bear the extra 4 annas he proposes to put on.

Rice is almost a negligible quantity, there being only 70 acres thereof. I do not think the imposition of an extra 4 annas will be dangerous, seeing that the present rate is not a very high one. Anyhow, with an area of 70 acres concerned, the rate cannot be widely felt as a hardship.

You will observe what the Superintending Engineer says in his No. 2620 of the 10th June, attached to this. I have only to remark that I am not able to follow him in the radical changes he suggests, and that it is impossible to make useful comparisons between the scientifically designed Chenab canal and distributaries with their perennial supply and the more or less happy-go-lucky cultivation on our ancient and ill constructed inundation canals and karias. The Superintending Engineer also does not seem to have noticed how insignificant the area under rice is, and how comparatively insignificant that under flow is, or to be aware that the fact that the quality of lift crops is superior to that under flow is due to other causes than that which, as he truly says, is not the cause—"that the water is lifted." It is obvious that, when land is commanded by flow, men cannot be expected not to use it, and, under existing irrigational conditions, it is not fair to penalise them because they use more water than men using lift, especially as they get no better crops. I may also observe that it is easy to make a general statement of the kind made in paragraph 10 of the Superintending Engineer's letter, but

that when careful inquiry and minute inspection demonstrate that lands cannot bear an increase of even a few annas, such general statements must be discarded.

15. Coming to the rabi rates, Mr. Moysey proposes to raise "sailab and sailab aided" 4 annas, and leaves other rates as at present. In view of the figures regarding the rental of these lands, I am not of opinion that the proposal will cause undue hardship, and think the increase may be imposed, but in that case the question arises whether bosi should not also be proportionally raised. It is admittedly less expensive than lift. This is for your consideration. I do not myself feel disposed to recommend the raising of a rate which the officer doing the revision settlement leaves alone, and so I do not include this in my recommendation. One of the petitions of objections received was against the raising of the "sailab" rate. As to this, I must point out that, where dehs have been raised from the 2nd to the 1st group, the actual increase will be 8 annas and not 4 annas only as appears at first sight. Still, I think the dehs concerned can stand it in view of Mr. Moysey's remarks regarding them.

16. As regards rates on unsurveyed lands, I am unable to see where the difficulties mentioned by Mr. Moysey lie. There are 5 classes of crop, and the description of each appears clear enough. The classification is the same as that prevailing in many other talukas. The principle of assessing "kacha" cultivation separately has been adopted throughout the province in accordance with the proposals of a committee which sat in 1886 to discuss, *inter alia*, this question. The existing rates appear to me reasonable, and I recommend that they be continued.

17. The petitions of objection which have been received are attached. These are two, and they do not call for particular remark. Mr. Moysey has reported at length on that of Alahdino and others, and his letter No. 1148 of the 13th July is attached.

18. The rates proposed by Mr. Moysey have been published for information, in accordance with standing orders, by him.

10. The slight difference between my recommendations and his proposals is given in the attached statement.

I have the honour to be,
Sir,
Your most obedient servant,

H. C. MULES,
Collector of Hyderabad.
