ANNUAL SEASON AND CROP REPORT—		
<i>I.—Character of the Season—</i>		
General remarks on the character of the Season	1-3	1-5
<i>II.—Area cultivated and uncultivated</i>	4-17	5-7
<i>III.—Cropped Area—</i>		
General remarks on <i>kharif</i> and <i>rabi</i> harvests	18-23	7-12
Detailed remarks on the principal food and non-food crops grown.		
<i>IV.—Irrigated Area—</i>		
General remarks on the different sources of irrigation and on crops irrigated	24-30	12-14
<i>V-V-A—Outturn of Crops—</i>		
General remarks on the estimate of outturn of <i>kharif</i> and <i>rabi</i> crops : acreage and outturn (in tons) of food-grain crops for 1925-26, 1924-25 and 1923-24	31-35	14-18
<i>VI.—Price, Trade and Stock—</i>		
General remarks : variations in price of staple crops and food stock	36	18-21
<i>VII.—Agricultural Stock</i>	37	21
<i>VIII and IX.—Condition of the Agricultural Population</i>	38-41	21-22
APPENDICES—		
A.—Area cultivated and uncultivated		23
B.—Cropped area		24-25
C.—Distribution of crops		26-27
D.—Irrigated area		28
STATISTICAL TABLES—		
I.—Rainfall		29-31
II.—Total area : area cultivated and uncultivated		32-37
III.—Cropped area		38-59
IV.—Irrigated area		60-69
V.—Estimated outturn of <i>kharif</i> and <i>rabi</i> crops in parts of 100		70-71
V-A.—Area under food-grain crops in each district of the Bombay Presidency and its estimated outturn during 1925-26 and preceding two years		72-86
VI.—Prices of staple articles of food and of fodder		87-89

No. P.—11 of 1927

From

Dr. H. H. MANN, D.Sc.,

DIRECTOR OF AGRICULTURE,

BOMBAY PRESIDENCY, POONA

To

THE SECRETARY TO GOVERNMENT,

REVENUE DEPARTMENT, BOMBAY.

Poona, 15th October 1927.

Sir,

I have the honour to submit herewith the Annual Season and Crop Report of the Bombay Presidency for the year ending 31st July 1927.

I have the honour to be,

Sir,

Your most obedient servant,

H. H. MANN,

Director of Agriculture.

SEASON AND CROP REPORT OF THE BOMBAY PRESIDENCY FOR 1926-27

CHAPTER I—CHARACTER OF THE SEASON

1. **General.**—The most dominant feature of the agricultural season of 1926-27 was the short duration of the rains (from July to September) and their uneven distribution during this short period. Thus, except in parts of the South Konkan there was practically no rain in June in most parts of the Presidency with the result that *kharif* sowings were delayed and considerable anxiety was felt on this account at the end of the month. The glorious rains received in July dispelled this anxiety in most of the Presidency (except in the south-east where more rain was still needed). But, the rain was ill-distributed in August, being excessive in Gujarat and Khandesh and once again deficient in the south-east. In September, the rains were almost ideal being light where they were previously excessive and copious where they were deficient before. It was thought, in fact, that the rains of this month (September) had made amends for their previous irregularities and the prospects were generally bright over most of the Presidency at the end of this month. The scales, however, once again turned. For, the rains were generally very deficient in October and practically absent from November onwards with the result that the *rabi* crops did well only in areas like Gujarat and Khandesh where the soils were sufficiently retentive and the rains in September sufficiently heavy, while they failed over a very large part of the east Deccan and Karnatak. To put the seasonal history in a nut-shell, it can be said that so far as the *kharif* crops were concerned, the season was quite satisfactory throughout the Konkan and the west of the Deccan and Karnatak and fairly satisfactory in Gujarat and Khandesh, though it was much below the normal in the east Deccan and east Karnatak (which, by the by, is not an important *kharif* area). As regards the *rabi* crops, the season was really first class nowhere but was still *fairly* good in most of Gujarat and Khandesh. In the most important *rabi* (late crop) area of the Presidency, namely, the east Deccan and Karnatak, however, it was definitely bad. In Sind, the inundation was late and this checked the *kharif* area. When once, however, the river rose it maintained a steady and good level till the close of the season and the *kharif* crops thus came out fairly successfully in most of the Province. The *rabi* crops also did well in the beginning but suffered later on very badly from frequent visitations of locusts and from frost in the winter in places. The season even in Sind was not thus fully normal.

Details regarding the season in its various aspects are contained in the following section.

2. **Distribution of Rainfall.**—Statement No. I (Pages 30-31) compares the rainfall of the year with the average fall of rain at each representative station in the Bombay Presidency and Sind. The average rainfall figures

for each station are, as during the last year, those supplied by the Indian Meteorological Department, based on the rainfall statistics available upto and including 1920.

Kharif Rains.—The *kharif* rains were considerably above the average throughout Gujarat. In the Deccan, they were somewhat below the usual amount in the North Deccan including Ahmednagar and rather above the standard in the south. In the Karnatak, except at Bijapur, where they were somewhat below the normal, they were generally above it elsewhere. In the Konkan, they exceeded the amount usually received at Thana and Ratnagiri but fell somewhat short of the standard at Alibag (Kolaba) and Karwar (Kanara). In Sind, these rains were considerably above the normal in the south and a little below it in the centre. In North Sind, however, they varied very widely. Thus at Sukkur, they were much above the normal; at Jacobabad (Upper Sind Frontier) they were a little below it while at Larkana they amounted to only a few drops against an average of three and a half inches.

Rabi Rains.—The *rabi* rains were far short of the average throughout the Bombay Presidency and were, as usual, negligible in Sind. Thus, they were practically absent in Gujarat while they were generally light in the Deccan, varying from a few drops to one and a half inches against an average of three to five inches. In the Karnatak, these rains amounted to a few drops at Belgaum and Bijapur and to about two and a half inches at Dharwar and in the hilly tracts—all against an average of from six to eight inches. In the Konkan, the rains varied from one to two inches against an average of from four to seven inches while in Sind, they were low as usual.

Hot-weather Rains.—These presented no features of special importance during the period under review.

3. Nature of the season in different Divisions.—The following remarks will show in detail the nature of the season in each Division of the Bombay Presidency including Sind.

Konkan.—The ante monsoon showers were practically absent. The regular monsoon started rather late and the rains in June being generally scanty and irregular (except in places on the coast in the South Konkan where they were sufficient to start *kharif* sowings) the agriculturists were in suspense for some time. From the first week of July, however, the rains started in right earnest and continued generally favourable to the end of September with the result that the sowing and transplanting operations were completed without any hitch and the crops progressed well. (The rains in August were rather excessive in places but did no material damage to crops.) With light showers in October, the rains almost completely withdrew. As a result, the *kharif* crops progressed very well generally and returned nearly a normal yield except late rice which suffered from want of late rains in places. The season was, on the whole, favourable in the division. As regards crop diseases, there was rather a serious attack of stem-borer on *vaingan* (late irrigated) rice round about Ratnagiri. The damage to the early mango crop from

mango-hoppers and mildew was also severe in places. The '*Koleroga*' disease on betelnut, however, was much less virulent than usual.

Gujarat.—The main features of the monsoon, in this division, were that it started late—by the end of June, ended early, by the third week of September, and, while it lasted, was unusually heavy and continuous through the major portion of its duration. In consequence there was delay in the sowing of *khari*f crops, they suffered in many places owing to excessive moisture, some resowing was found necessary in low-lying areas and the cultivators were unable to weed properly their fields which were over-choked with weeds. The excessive rains in August and September, in fact, created an anxiety of wet famine but the break in the last week of September and onwards proved very beneficial and the outturn of the *khari*f crops was, on the whole, fairly satisfactory in most places. As regards the *rabi* crops, owing to the abrupt cessation of rains in the third week of September, the soil got packed under the intense heat of October and the agriculturists found it hard to prepare well their fields for the *rabi* sowings. When once, however, the seed was put in the ground, the crops seemed to have managed well on the strength of the previous moisture. The severe frost about the middle of January affected the crops in places while the repeated visits of locusts between the middle of December and the end of February reduced the yield of the crops in many places—especially in the Ahmedabad district and the adjoining Kathiawar Territory. With these drawbacks however, the *rabi* season must be said to be generally favourable for the division as a whole if we judge the net result—the actual outturn which was in no way below the normal. For, what was lost in the condition of the crops was made up by the very much more extended areas under them. As regards crop diseases, the peculiar conditions of the season favoured rapid spread of *jowar* borer in Surat district and cotton wilt in Broach District, while hairy caterpillars (*katras*) in maize and other young crops in Dohad were unprecedentedly virulent and they also appeared in Jambusar taluka (Broach district) for the first time. The damage from locusts has already been noted. An attack of grass-hoppers also did considerable damage in parts of the Ahmedabad and Broach districts.

Deccan.—The rains were insufficient for *khari*f sowings till the end of June and the situation appeared somewhat threatening at the end of the month. It was much eased by the good and opportune rainfall in July which was copious in the West Deccan and in Khandesh where, in consequence, the sowings were completed and transplantation of rice, *nagli* and hillmillets was undertaken near the Sahyadris. In the east, however the rain was not adequate everywhere and more was needed for the completion of the sowings and for helping the germinated seedlings. The rain in August was ill-distributed, being excessive in Khandesh and the West, checking interculturating operations and stunting the growth of the crops there while it was deficient in the east where the crops further deteriorated. The September rain was, however, just what it should be—light in Khandesh and in the West Deccan relieving the over-watered crops there—and ample in the East Deccan where it revived the withering *khari*f crops and enabled *rabi* sowings to be undertaken. In fact, the

September rains considerably improved the prospects almost throughout the division. From October onwards, however, the rains were either light or absent with the result that while the crops in areas where there had been heavy rains in September and where the soil was retentive did well generally, those in other area were definitely poor. The season, on the whole, was good in the West Deccan and fairly good over a large part of Khandesh but poor in many places in the East Deccan necessitating grants of suspensions and remissions. Even in Khandesh, the cotton and wheat crops suffered owing to the late sowings and to the want of moisture later on in the season. The irrigated crops, however, did very well generally in most parts of the division. A happy feature of the season was perhaps that it was free from insect pests and fungus diseases of any serious type in most parts.

Karnatak.—Some good showers were received during May which helped the preliminary field operations. The rainfall in June was patchy and *kharif* sowings, in consequence were confined to the more favourable situations. The July rains were good in the west where the *kharif* sowings were completed and transplantation of rice, *naghi* etc., was undertaken. In the east, however, the rains proved inadequate and good showers were needed both to complete the sowings and to help the germinated seedlings. In August, the distribution of the rain was generally bad—the rain proving excessive in the West where it hampered the agricultural operations of weeding, interculturing, etc., and checked the proper development of the crops. In the east, on the other hand, the rain proved deficient with the result that the crops here further deteriorated. The rains in September, however, were very favourable both as regards amount and distribution, being light in the west and copious in the east thus relieving the overwatered crops in the first area (west) and helping the withering *kharif* crops and enabling the undertaking of *rabi* sowings in the second (east). In fact, the September rains seemed to have made amends of the irregularities in the past. But, in October the rain was very light while from November onwards it was almost entirely absent. The result was that the *rabi* crops suffered seriously from deficiency of moisture and almost entirely failed in many places in the east and were generally from poor to fair in the centre. Even the *kharif* crops which did not get the requisite moisture till September were generally moderate in the east of the division. Thus except in the west, the season under review was generally very unsatisfactory in the division necessitating grants of suspensions and remissions to a varying extent in all the three districts. Even the irrigated crops like sugarcane, tobacco, etc., suffered later on in the season from deficient water supply in irrigation sources and yielded below normal.

Sind.—The main factor in the agricultural season of this Province is the inundation of the Indus. This caused great anxiety at the outset as the inundation was much below normal in June. This not only brought out a reduction in the area of some of the *kharif* crops but was responsible for a distinct set back to the cotton acreage. It was only in the end of June that the river attained its normal level and thence forward continued to rise gradually and steadily and sustained a good irrigation level till

the close of the season. The rainfall, on which the Province does not usually much depend in most parts, was also more than normal in July and August in both Upper and Lower Sind. This proved beneficial to *kharif* crops generally with the exception of low-lying areas where it lodged standing *jowar* and submerged young cotton. The winter rains were generally very scanty and did not do any appreciable good to *rabi* crops but the severe frost in the cold weather was definitely injurious for these (*rabi*) crops, in many places. As regards crop diseases the most peculiar feature of the season was the wide-spread and frequent visitations of locusts throughout the Province which were responsible for a considerable damage to crops especially to cotton and wheat. There was a very large death rate among American cotton plants amounting in many cases to thirty per cent. from unknown causes while the attack of grass-hoppers was rather serious on paddy in the Sukkur district.

CHAPTER II—AREA CULTIVATED AND UNCULTIVATED

(Statement No. II pages 32 to 37)

4. **Number of villages.**—The total number of villages in the Bombay Presidency proper rose by eight from 22,913½ in 1925-26 to 22,921½ during the year under report. There was an increase of nineteen villages in the Dharwar district due to correction in previous records and of one village in the Nasik district due to survey measurements. Against this there was a decline of nine villages in the Ratnagiri district due to this number of (nine) villages in the Devgad taluka having been amalgamated with the neighbouring villages in the same taluka. There was also a decrease of three villages in the East Khandesh district owing to correction of mistake since detected.

In Sind, the number of villages increased by sixteen owing to creation of thirteen new *dehs*, in the Karachi district from the portions of unsurveyed *dehs* and to an increase of three villages in the Hyderabad district due to survey measurements.

Total Area and Reporting and Non-reporting Area in the Bombay Presidency proper

5. **Total Area.**—The total area showed an increase of 23,000 acres in the Bombay Presidency proper, most of the increase (21,000 acres) occurring in the Belgaum district due to correction of mistake detected in survey records. The remaining increase of two thousand acres occurred in the districts of Poona and Ahmedabad (1,000 acres each) and was also due to survey corrections in those districts.

6. **Reporting Area.**—The total area for which statistics are regularly collected and reported rose by 32,000 acres in the Bombay Presidency proper. The most noticeable increase occurred in the Panch Mahals (+ 58,000 acres) due to the area, of thirty-seven unsurveyed *Inam* villages in the Dohad taluka which were surveyed during the year under report, having been added to the class of "available statistics". Another important increase occurred in the Satara district (+ 10,000 acres) due to the introduction of survey and settlement in two unsurveyed *Inam* villages in the Khatav taluka. Against this increase, there was

a set back of thirty-five thousand acres in the Kaira district due to right classification of certain villages in the district. The variations in other districts are small and call for no remarks.

7. Non-reporting Area.—The increase of thirty-two thousand acres in the “reporting area” has already been noted under that head above. This increase means a corresponding decline under the present head “non-reporting area”. Against this decline of thirty-two thousand acres, there was an increase of twenty thousand acres in the Belgaum district due to correction of mistakes detected in survey records—the net result being a decline of twelve thousand acres in all, for the Presidency proper as a whole.

Total Area and Reporting and Non-reporting Area in Sind

8. Total Area.—The total area showed an increase of seventy-eight thousand acres in the Province, mostly in the Karachi district (+ 73,000 acres) due to survey operations, *bigoti* measurements and *kacha* lands left by the river. The remaining increase of five thousand acres was divided between Sukkur (+ 3,000 acres) and Nawabshah and Larkana (+ 1,000 acres each) chiefly due to the formation of new *kacha* lands by the action of the river.

9. Reporting Area.—The reporting area showed a decline of 702,000 acres. The most noticeable decrease occurred in the Larkana district (— 756,000 acres) due to transfer of this area (of 756,000 acres) during the year under report to the right heading *i.e.* from the class of “available statistics or reporting area” to the class of “unavailable statistics or non-reporting area”. A similar but much smaller decline also occurred in the Nawabshah district (— 22,000 acres) due to the same cause. Against this there was an expansion of seventy-three thousand acres in the Karachi district due to right classification and of three thousand acres in the Sukkur district due to formation of new *kacha* lands in the district.

10. Non-reporting Area.—The variations under this head generally correspond with those under the “reporting area” which have been noticed above.

11. Estimates for Non-reporting area.—Estimates of the probable cropping of the areas for which statistics were not forthcoming were, as usual, received from all the District officers. Even in the case of the Ratnagiri district, the estimates were received, for the first time, from the Collector of that district.

12. Cultivated (i. e. occupied) and Uncultivated Area.—Details regarding this, as compared with the last year are shown in Appendix A (page 23).

13. Gross Cropped Area.—In the Bombay Presidency proper, the gross cropped area expanded by 386,000 acres. The most noticeable increase occurred in Gujarat (+ 218,000 acres) and Deccan, except Ahmednagar (+ 198,000 acres) due to the good, though somewhat late, *khari*f rains which encouraged extended sowings in most parts of these divisions and the excellent September rains which gave an impetus to *rabi* sowings

on an extensive scale. On the other hand, there was a set back in the Karnatak (—21,000 acres) mostly in the Bijapur district (—25,000 acres) where the rains were generally deficient in the season, and in the Konkan (—9,000 acres) due to the area under rice being checked, in parts, owing to the withholding of rains in June.

14. Twice Cropped Area.—This showed an extension of 178,000 acres in the Bombay Presidency proper the increase being shared by all the Divisions and chiefly Gujarat. Thus, in Gujarat, the double cropped area increased by 145,000 acres due to the copious rains of the season which left ample moisture in the soil for a second crop to be taken on the same land. The same cause brought about an extension, though to a much less extent, in the other divisions *viz.*, Deccan (+ 21,000 acres) Konkan (+ 11,000 acres) and Karnatak (+ 1,000 acres).

15. Net Cropped Area.—This advanced by 208,000 acres in the Bombay Presidency proper. The causes which led to the increase in the case of the Deccan (+ 178,000 acres) and Gujarat (+ 72,000 acres) and of the small decline in the Karnatak (—22,000 acres) and the Konkan (—20,000 acres) are the same as already noticed under the "gross cropped area" above.

In Sind, the gross cropped area, the area cropped more than once and the net-cropped area rose by 393, 62, and 331 thousand acres respectively due to the good and steady inundation of the season, though it was some what late in the beginning.

16. Assessed and Unassessed Area.—In the Bombay Presidency proper, the assessed area decreased by thirteen thousand acres while the unassessed area showed an expansion of nineteen thousand acres. In Sind similarly, while the assessed area fell by seventy-eight thousand acres, the unassessed area showed an increase of 148,000 acres.

17. Temporary Cultivation in Forest Lands and Culturable Waste.—In the Bombay Presidency proper about 77,000 acres of Forest lands were given out for temporary cultivation mainly in West Khandesh (28,000 acres), Poona and Sholapur (21,000 acres each), Ahmednagar (3,000 acres), and Thana (2,000 acres); and about 55,000 acres of Culturable Waste mainly in West Khandesh (18,000 acres), Thana (12,000 acres), Nasik (6,000 acres), Broach and Belgaum (4,000 acres each), Satara (3,000 acres), East Khandesh and Kolaba (2,000 acres each) and Ahmednagar and Poona (1,000 acres each) were similarly dealt with.

In Sind, the area under Forest was, nearly the same as last year but that under Culturable Waste fell by 93,000 acres (the decrease being shared by all the districts except Karachi).

CHAPTER III—CROPPED AREA

(Statement III, Pages 38 to 59)

18. Variations in Cropped Area.—The main features of the season and of the harvest have been described elsewhere in the Report. Appendix B (pages 24-25) shows the effect of the season under report on the area sown as compared with the average and with the preceding year's area under the principal crops.

19. Food Crops.—In the Bombay Presidency proper, the area under food crops rose by 1,309,000 acres or by 7·1 per cent. over the previous year and by 290,000 acres or 0·1 per cent. over the average. Among the *kharif* crops bajri and rice showed an extension of 981 and 65 thousand acres respectively due to the abundant, though somewhat late, *kharif* rains whereas among the *rabi* crops, wheat and gram showed an expansion of 198 and 46 thousand acres respectively due to the excellent September rains in most parts of the Presidency. *Jowar* (mostly *rabi*) however showed a decline of 412,000 acres or 5·3 per cent. below the previous year, due to the unsatisfactory character of the *rabi* season in the chief *rabi jowar* area, namely, the south-east of the Presidency. The area under sugarcane was nearly stationary.

20. Non-food crops.—The area under non-food crops cropped by 923,000 acres or by 9·9 per cent. as compared with the previous year though it was still substantially above the average (+ 1,003,000 acres or 13·5 per cent). The most marked decline occurred in Cotton which showed a curtailment in area of 848,000 acres or—16·6 per cent. below the previous year, the chief reason being the fall in the price of the article, and the unfavourable character of the season in the principal cotton tracts. The area under oil seeds was very much about the same as last year while that under tobacco showed a slight decline mostly in the Kaira district due to the excess of rains there.

The net result of the variations in the food and non-food crops, as noted above, was an increase of 386,000 acres or 1·5 per cent. over the total cropped area of the last year and of 1,293,000 acres or 4·9 per cent. over the average.

21. Cropped Area in Sind.—In Sind, with the exception of rice and cotton which showed a set back of 167 and 36 thousand acres respectively, the former (rice) chiefly owing to the late inundation of the year and the latter (cotton) mainly to the fall in prices, the area under all the crops, both food and non-food rose considerably both over the previous year and the average, due to the good and steady inundation after when once it started.

22. Kharif and Rabi Seasons.—The following table compares, as usual, the *kharif* and *rabi* seasons of the year in the Bombay Presidency proper with those of the preceding two years:—

Area in thousands of acres

Details	1924-25			1925-26			1926-27		
	Cereals	Pulses	Total Cereals and pulses	Cereals	Pulses	Total Cereals and pulses	Cereals	Pulses	Total Cereals and pulses
Kharif.	8,890	1,365	10,255	8,945	1,534	10,479	10,519	1,860	12,379
Rabi.	7,687	652	8,339	7,005	483	7,488	6,383	705	7,088
Total.	16,577	2,017	18,594	15,950	2,017	17,967	16,902	2,565	19,467

It will be seen from the above table that the *kharif* area was much above the last year as well as over that in 1924-25. On the other hand, the *rabi* area showed an appreciable decline as compared with 1925-26, though it showed a slight extension over 1924-25. The net result of these variations was an increase under the total area under cereals and pulses as compared with both 1925-26 and 1924-25.

23. Variations under principal Crops.—The detailed remarks below explain the variations under the principal crops.

Jowar and Bajri.—The following table compares the extent of cultivation of these staple grains in the different divisions of the Bombay Presidency:—

(Figures in thousands of acres.)

Division.	Jowar			Bajri		
	*Normal	1925-26	1926-27	*Normal	1925-26	1926-27
Gujarat ..	610	530	641	426	291	391
Deccan ..	4,595	4,841	4,382	3,419	2,927	2,650
Karnatak ..	2,697	2,448	2,381	394	414	572
Total, Bombay Presidency ..	7,902	7,819	7,404	4,239	3,632	4,613
Sind ..	593	496	628	1,029	1,019	1,174
Grand Total ..	8,500	8,315	8,032	5,268	4,651	5,787

* Average of the five years 1916-17 to 1922-23 excluding the two abnormal years 1918-19 and 1920-21.

Owing to the deficiency of rains, the area under *jowar* (chiefly *rabi*) showed a considerable drop in the Deccan and Karnatak both below the previous year and the normal but the decline was more than made up by the increase in the area under *bajri* the cultivation of which increased in all the divisions of the Bombay Presidency.

In Sind, the area under both the crops (*jowar* and *bajri*) showed an extension both as compared with the previous year and with the normal.

Rice.—The area under rice increased by fifty-nine thousand acres in the Bombay Presidency proper the chief increase occurring in Gujarat (+ 70,000 acres) where the abundant *kharif* rains allowed extended sowings under the crop. There was also an increase in the Deccan (+ 1,000 acres) and the Karnatak (+ 3,000 acres) but it was negligible. Against this, there was a contraction in the Konkan (–15,000 acres) chiefly in the Ratnagiri district where, the deficiency or absence of rains in June checked the sowings under the crop.

In Sind, the area under the crop receded by 167,000 acres and the decrease was shared by all the districts. This was due to the late inundation of the season.

Wheat.—In the Bombay Presidency proper, the area under wheat extended by 198,000 acres. The most marked increase occurred in the Gujarat division (+ 243,000 acres) where the ^{5th} September rains

and the generally retentive soils allowed a very much extended cultivation of the crop. Against this there was a set back in the Deccan (—33,000 acres) and the Karnatak (—12,000 acres) due to the unfavourable character of the rains chiefly in the east of these divisions.

In Sind, the area under the crop remained stationary in the Karachi and Hyderabad districts but increased everywhere else due to the favourable behaviour of the river after once it rose. The net result was an increase of 104,000 acres in the Province, as a whole.

Oilseeds.—In the Bombay Presidency proper, the area under oilseeds (1,219,000 acres) remained almost just the same as compared with the last year (1,220,000 acres) though, when compared with the average (882,000 acres) it showed an increase of 337,000 acres or of about forty per cent. (actual 38·2).

In Sind, the area under oil-seeds increased by 119,000 acres or 54·8 per cent. as compared with the previous year though it fell somewhat short of the average (—21,000 acres or —6 per cent.).

The following table and the succeeding remarks explain the variations under the principal oilseeds as compared with the previous year :—

Increase or decrease in thousands of acres as compared with the last year.

Oil-seed				Bombay Presidency	Sind.
Linseed	—14
Sesame	— 8	+ 6
Rapeseed and Mustard	+12	+35
Groundnut	+15
Castorseed	—16	+ 4
Cocoonut	—15

Groundnut.—This crop is becoming more and more popular with the cultivators every year due to the good prices and the ready sale it obtains in the market, and consequently the area under it is advancing recently almost by leaps and bounds. When during 1925-26 the area under the crop rose to 592,000 acres from 344,000 acres in its preceding year (1924-25) it was thought that the maximum limit of cultivation had probably been reached. The advance during the year under review of a further fifteen thousand acres shows that there is still some possibility of further extension. How far this will be realised will of course depend on the market prices and the character of the seasons during the next few years. So far as the year under report is concerned, the area under the crop showed a rather serious set back in Khandesh (—63,000 acres) and a slight one in North Gujarat (—9,000 acres) due to the excessive rains of the season there but it showed an extension in almost all the remaining areas with the net result that, as noted above, the total area under groundnut in the Bombay Presidency exceeded that of the previous year by fifteen thousand acres. The increased cultivation of groundnut is, in fact, one of the most striking agricultural changes in recent years.

Sesamum.—The area under sesamum receded slightly—by eight thousand acres, below the previous year owing partly to the unsuitability of the rains at the time of putting the seed in the ground and partly due to more area being put under groundnut.

Linseed.—The area under this crop showed a decline of fourteen thousand acres in the Bombay Presidency proper, mostly in the south-east due to the deficiency of the rains in this area.

Rape and Mustard.—These showed an increase of twelve thousand acres in the Bombay Presidency proper chiefly in North Gujarat (+ 8,000 acres) and Dharwar (+ 3,000 acres), where owing to the ample moisture left in the soil by the good September rains, the cultivators were encouraged to put more area under these oilseeds.

Castorseed.—The area under this oilseed showed a shrinkage of sixteen thousand acres mostly in Kaira (– 9,000 acres) and Surat (– 6,000 acres) due to excessive rains experienced here at the time of sowing.

Oilseeds in Sind.—As regards oilseeds in Sind, the only oilseeds of importance in the Province are Rapeseed and Mustard (which are by far the most important) and Sesamum; the area under other oilseed such as linseed, groundnut, castorseed, cocoanut, etc., being quite negligible in this Province. The area under rapeseed and mustard rose by thirty-five thousand acres while that under sesamum by six thousand acres and the increase in both cases was due to the good and steady, though somewhat late inundation of the year.

Cotton.—The cultivation of cotton received a serious set back during the year under report both in the Bombay Presidency proper and in Sind, the main cause of the decline being the considerable drop in the price of the article during the last two or three years. The vagaries of the season such as the late commencement of the monsoon over most of the Presidency, the excess of rains in most parts of Gujarat and Khandesh, the deficiency of the rains in the south-east of the Presidency and the late rise of the river in Sind affected also prejudicially the area under the crop. The decline in area was general but was most marked in Gujarat (– 442,000 acres). In the Deccan it amounted to 207,000 acres and in the Karnatak to 200,000 acres. In Sind, the decrease of thirty-seven thousand acres was divided between Hyderabad (– 20,000 acres) and Nawabshah (– 17,000 acres).

Sugarcane.—The area under the crop remained stationary both in the Bombay Presidency proper (64,000 during the year under report against 65,000 during the preceding year) and in Sind (3,000 acres during the year under review as against 3,000 acres in 1925-26).

Tobacco.—The area under tobacco receded by fourteen thousand acres. Most of the decline occurred in the Kaira district (– 13,000 acres) where the cultivation of the crop received a check due to the excessive rains of the season.

Fruits and Vegetables.—These showed a set back of 196,000 acres in the Bombay Presidency proper and of five thousand acres in Sind. The decline is however only apparent being due to the transfer of *math* (kidney

bean, *Phaseolus aconitifolius*) and *Val* (large-fruited dolichos, *Dolichos lablab*) from the class of vegetables to the class of "pulses."

CHAPTER IV—IRRIGATED AREA

(Statement No. IV, pages 60 to 69)

24. Variations in Irrigated Area and Crops.—Appendix D (page 28) exhibits variations under the several heads of irrigation and crops irrigated as compared with similar details of the previous year.

25. Area Irrigated.—In the Bombay Presidency proper the area irrigated rose slightly—by twenty-seven thousand acres or 2·8 per cent. over the previous year, having advanced from 996,000 acres in the last year to 1,023,000 acres during the year under report. The most noticeable increase occurred in the Deccan (+57,000 acres) mostly in the southeast where owing to the deficient rains of the season, fullest use had to be made of the irrigation facilities available. Against this, there was a set back in Gujarat (—29,000 acres) and in Belgaum (—6,000 acres) in the Karnatak, where owing to the ample rains of the season there was not the same necessity to resort to irrigation sources. In Sind, the irrigated area advanced by 97,000 acres or by 3·2 per cent. from 3,016 thousand acres in 1925-26 to 3,113 thousand acres during the year under report owing to the favourable character of the inundation after its commencement.

26. Area irrigated from different sources of Irrigation in the Bombay Presidency Proper—

Government Canals.—The area under Government canals increased by 54,000 acres. Almost the whole or the increase (53,000 acres) occurred in the Deccan, chiefly in the south-east, where owing to the scanty rainfall of the season, the cultivators had to resort to this important source of irrigation to the greatest possible extent.

Private Canals.—Irrigation from private canals advanced by four thousand acres or by about 7·8 per cent. The variations are generally small and call for no special remarks.

Wells.—Well irrigation receded by twenty-six thousand acres in the Bombay Presidency proper and the decrease almost exclusively occurred in the two districts of Ahmedabad and Kaira in North Gujarat (16,000 acres in Ahmedabad and 9,000 acres in Kaira) where owing to the excessive rains of the season the farmers did not feel the necessity of resorting to this labourious and expensive measure of watering their lands.

Tanks.—The area irrigated from tanks rose very slightly from 137,000 acres in 1925-26 to 140,000 acres during the year under report. There was no marked variation in any district which calls for special attention.

Other sources.—The area irrigated by "Other Sources" fell by ten thousand acres. The most noticeable decrease occurred in Ahmedabad (—12,000 acres) and was due to the same causes as already noted under "wells" above. The variations in other districts are generally negligible.

27. Area Irrigated from Different Sources of Irrigation in Sind—

Government Canals.—In Sind, which is mainly dependent for cultivation on irrigation, the area irrigated by Government canals rose by 118,000 acres due to the favourable nature of the inundation, after its commencement. Thar Parkar, Nawabshah and Upper Sind Frontier Districts showed a substantial increase while the area remained almost stationary in the case of the Larkana and Sukkar districts and showed as light set back in the case of the Karachi and Hyderabad districts.

Private Canals.—There is hardly any cultivation, worth the name, under private canals in Sind except, perhaps, in the district of Sukkur. In this district the area fell from 15,000 acres during the previous year to 8 000 acres during the year under report.

Wells.—Irrigation by wells fell by seven thousand acres chiefly owing to an extension under the Government canals.

Tanks.—The area irrigated by tanks is quite negligible in Sind—the total area in the Province hardly exceeding one thousand acres and the variations under the source are thus hardly worth a note.

Other Sources.—Irrigation from “Other Sources” fell by seven thousand acres. The variation in no district is large enough to call for special remarks.

28. The ratio of irrigated area to net cropped area was 3·7 per cent. in the Bombay Presidency and 72·8 per cent. in Sind.

29. Crops Irrigated (Bombay Presidency Proper)—

Jowar.—The area under irrigated *jowar* fell by fifteen thousand acres in the Bombay Presidency proper mostly in the Ahmedabad district (—15,000 acres) where owing to the excessive rains of the season no necessity was felt of helping the crop with irrigation to the usual extent.

Bajri.—Irrigated *bajri* rose by nineteen thousand acres and the increase occurred exclusively in the Deccan and mostly in the south of the division where owing to the deficient rains of the season the crop had to be helped with irrigation.

Rice.—The area under irrigated rice fell by five thousand acres mostly in Ahmedabad (—4,000 acres) and Kaira (—2,000 acres) districts where owing to the abundant rains of the season, there was no necessity to help the crop with artificial water-supply to the usual extent.

Wheat.—Irrigated wheat remained quite stationary and thus demands no special notice.

Cotton.—The area under irrigated cotton rose by two thousand acres in the Bombay Presidency proper, the chief increase occurred in Sholapur (+4,000 acres) and Poona (+2,000 acres) where the crop had to be helped with irrigation owing to the deficient rains of the season in the cotton areas of these districts. On the other hand there was a set back

in the Ahmedabad district (—4,000 acres) where owing to the excessive rains of the season the crop had sufficient moisture to fall back upon and did not require any artificial water supply to help it.

Sugarcane.—The area under sugarcane remained just what it was during the preceding year.

30. Crops Irrigated in Sind—

In Sind, the area under irrigated **rice** fell by 167,000 acres due to the late inundation of the season. Similarly, the area under irrigated **cotton** declined by 38,000 acres chiefly due to the fall in the price of the article during recent years. On the other hand irrigated **wheat**, **jowar**, and **bajri** rose by 57, 98 and 77 thousand acres respectively due to the favourable nature of the inundation, after it started. The area under **sugarcane** remained just the same as during the preceding year.

CHAPTER V—OUTTURN OF CROPS

(Statements V and V-A, pages 70 to 86)

31. Yield of Principal Crops.—Statement V (pages 70-71) shows the estimated yield of the principal *kharif* and *rabi* crops in parts of 100 which is taken as normal. It is prepared from the district estimates which are returned in annas taking twelve annas to represent a normal crop. The figures are therefore approximate only. The character of the season has already been described elsewhere.

32. Outturn of Crops in the Bombay Presidency Proper in parts of the normal—

A—Kharif Crops—

Jowar.—Except in Khandesh and Satara in the Deccan and Kaira in Gujarat where it came to four-fifths of the normal and in Thana in Konkan where it was about three-fourths of the normal, the outturn of *kharif jowar* ranged from one-half to two-thirds of the normal in all the other parts of the Bombay Presidency.

Bajri.—The outturn of *bajri* was generally good in the North Deccan and in Satara where it ranged from four-fifths to a full normal. In all the other districts the yield of the crop varied between one-half and three-fourths of the normal.

Rice.—Rice returned a full normal yield in the Bombay Suburban, Kolaba and Ratnagiri districts in the Konkan and in Ahmednagar in the Deccan, and a nearly normal yield in Thana in the Konkan, Poona and Nasik in the Deccan and Surat in Gujarat. In the other district the yield of the crop ranged from two-thirds to four-fifths of the normal except Bijapur where it came to only one-half of the normal.

Cotton.—The yield of cotton came to about one-half of the normal in Ahmedabad, the Panch Mahals and Surat and to three-fourths of the normal in Kaira and Broach in Gujarat. In the Deccan, the crop returned about three-fourths of the normal in East Khandesh, a little over half the normal in Ahmednagar and Poona and about two-thirds

of the normal in all the other districts of the Division. In the Karnatak, the yield of the crop came to one-half of the normal in all the three districts.

Sesamum.—In Gujarat, the oil-seed yielded from forty to sixty per cent. of the normal in all the districts. In the Deccan, the crop yielded four-fifths of the normal in East Khandesh, three-fourths of the normal in Nasik and Satara and from about one-half to two-thirds of the normal in the other districts. In the Karnatak, the return from the crop generally ranged between one-half and two-thirds of the normal. In the Konkan, the crop yielded from four-fifths to a full normal in the north but in the two districts in the south (Kanara and Ratnagiri) the yield came to only about two-thirds of the normal.

B—Rabi Crops—

Jowar (rabi).—The yield of *rabi jowar* came to four-fifths of the normal in the Kaira district, to three-fourths of the normal in Ahmedabad and the Panch Mahals and to two-thirds of the normal in the Broach and Surat districts. In the Deccan, the crop returned nearly a normal yield in the Satara district and about four-fifths of the normal in the district of Sholapur. In the other districts of the division the outturn of the crop ranged between one-half and two-thirds of the normal except in Poona, where the crop was poor and yielded only about two-fifths of the normal. The yield of the crop was also generally poor in the Karnatak where it came to only about two-fifths of the normal in all the three districts.

Wheat.—In Gujarat, the yield of wheat came to four-fifths of the normal in Kaira and the Panch Mahals, to three-fourths of the normal in Broach and to two-thirds of the normal in the remaining two districts (Ahmedabad and Surat). In the Deccan, the crop returned nearly a normal yield in the Satara district and three-fourths of the normal in Sholapur. In the remaining districts, the outturn of the crop ranged from one-half to two-thirds of the normal. In the Karnatak, the crop returned two-thirds of the normal yield in the Belgaum district but only one-third of the normal in the other two districts (Bijapur and Dharwar).

Gram.—Gram returned from two-thirds to three-fourths of the normal in Gujarat. In the Deccan except in the Satara district where the yield came to three-fourths of the normal, the outturn of the crop ranged between one-half and two-thirds of the normal. In the Karnatak, the crop was generally poor and yielded from two-fifths to one-half of the normal. In the Konkan, the yield of the crop varied very widely. Thus, the yield came to a full normal in the Kolaba district to three-fourths of the normal in the Thana district, to two-thirds of the normal in the Ratnagiri district and a little over half the normal in the Kanara District.

Tobacco.—The yield of tobacco varied between two-thirds and four-fifths of the normal in Gujarat. In the Deccan, the crop returned a

little over half the normal in Poona and two-thirds of the normal in Sholapur. In the other districts of the division the crop yielded from three-fourths to four-fifths of the normal. In the Karnatak, the outturn of the crop ranged from one-half to two-thirds of the normal.

Linseed.—In Gujarat, the oil-seed returned about four-fifths of the normal in Kaira and one-half of the normal in the other districts. In the Deccan, the crop yielded about four-fifths of the normal in Satara. In the other districts of the division the outturn of the crop ranged from one-half to two-thirds of the normal except in the Poona district where the crop was poor and returned only one-third of the normal. In the Karnatak also the crop was generally poor and returned from two-fifths to one-half of the normal.

Rapeseed and Mustard.—Except in the Kaira district in Gujarat where the crop returned about four-fifths of the normal, the yield of the crop ranged between one-half and two-thirds of the normal throughout the Bombay Presidency proper.

33. Outturn of Crops in Sind in Parts of the normal—

A—Kharif Crops—

Jowar.—In Sind, the outturn of *kharif jowar* ranged between one-half and two-thirds of the normal except in the Thar Parkar district where it was somewhat less than half the normal.

Bajri.—*Bajri* returned from a little more one-half to two-thirds of the normal in all the districts of the Province.

Rice.—The yield of rice came to three-fourths of the normal in Karachi a little over one-half the normal in Hyderabad and only about two-fifths of the normal in Thar Parkar. In all the other districts of the Province the outturn of the crop came to about two-thirds of the normal.

Cotton.—In the three cotton districts of the Province which occupy more than ninety-nine per cent. of the total area under the crop, namely Hyderabad, Nawabshah, and Thar Parkar, the yield of cotton was generally poor coming only to one-half of the normal in Hyderabad and Thar Parkar districts and to only one-third of the normal in the Nawabshah district. In the other districts the crop yielded better about two-thirds of the normal generally but the area in these districts being negligible the better outturn has not much economic significance.

B—Rabi Crops—

Wheat.—Wheat was generally poor in the Thar Parkar district where it yielded only about two-fifths of the normal. In the other districts of the Province, the outturn of the crop ranged between one-half and two-thirds of the normal.

Gram.—Just as in the case of wheat, gram was very poor in the Thar Parkar district where it returned only one-fourth of the normal. In all other districts of the Province the crop yielded from one-half to two-thirds of the normal.

Tobacco.—The crop came out generally successfully in the Upper Sind Frontier District where it returned about four-fifths of the normal yield. Elsewhere in the Province, the outturn of the crop ranged between one-half and two-thirds of the normal.

Rapeseed and Mustard.—The oil-seeds yielded about two-fifths of the normal in the Karachi and Thar Parkar districts and a little more than one-half in the Sukkur district. In the remaining districts of the Province, the outturn of the crops came to one-half the normal.

34. Outturn of Sugarcane in the Bombay Presidency including Sind.—In Gujarat, sugarcane gave a fully normal yield in the Kaira District and nearly a normal yield in the Panch Mahals. In the other districts the yield of the crop ranged from two-thirds to four-fifths of the normal. In the Deccan, except in East Khandesh where the crop returned about three-fourths of the normal, the outturn of the crop in all the other districts of the Division came to about normal. In the Karnatak, the yield came to four-fifths of the normal in Bijapur, to two-thirds of the normal in Dharwar and to three-fourths of the normal in Belgaum. In the Konkan, except in Ratnagiri where the yield of the crop amounted to two-thirds of the normal, the crop returned about four-fifths of the normal in all the other districts of the division.

In Sind, sugarcane yielded about four-fifths of the normal in the Upper Sind Frontier District and three-fourths of the normal in the Karachi and Sukkur districts. In the other districts of the Province the yield of the crop came to about one-half of the normal except in the Thar Parkar District where the crop was poor and yielded only about two-fifths of the normal.

35. Outturn in Tons of Food-grain Crops.—

Statement V-A (pages 72 to 86) compares the acreage under food-grain crops (cereals and pulses) in the various divisions of the Bombay Presidency and their approximate out-turn in tons, during the year under report, with similar statistics for the two preceding years. The following table sums up the result :—

Division	Area in thousands of acres			Outturn in thousands of tons		
	1924-25	1925-26	1926-27	1924-25	1925-26	1926-27
Gujarat	2,092	1,798	2,549	734	440	759
Deccan	10,627	10,219	10,748	2,010	1,757	1,956
Karnatak	4,282	4,451	4,619	974	816	720
Konkan	1,592	1,499	1,551	671	624	663
Total, Bombay Presidency ..	18,594	17,967	19,467	4,389	3,637	4,098
Sind	3,899	3,528	3,782	1,042	809	904
Grand Total ..	22,493	21,495	23,249	5,431	4,446	5,002

It will be noticed that while the area under food-grains in the Bombay Presidency proper rose by 8·4 per cent. the outturn rose by 12·8 per cent. thus depicting the favourable character of the season as compared with the previous year although when the results are compared with 1924-25 it will be found that in spite of an increase in area over that year, the outturn falls short of that obtained in that year (1924-25).

In Sind, the same phenomenon which is noticed in the case of the Bombay Presidency proper is noticed in this case (Sind). In other words, while the area under the food-grains has increased by 7·2 per cent. over the previous year, the outturn has gone up still higher 11·8 per cent. thus depicting the steady and favourable nature of the inundation after once it started. As compared with 1924-25 however, a drop in area as well as in outturn is noticed in the case of the Province.

CHAPTER VI—PRICES, TRADE AND STOCK

36. Prices of Principal Articles.—Statement VI (pages 88-89) shows in detail the retail prices of the principal staples and of fodder ruling at harvest time at each district head-quarter stations in Bombay Presidency and in Sind. The detailed remarks below explain the variations in prices of the principal articles.

Jowar.—In the Bombay Presidency proper, *jowar* was dearer by from two-thirds of a seer to one and two-third seers per rupee at Ahmedabad, Broach, Sholapur, Satara and Bijapur while it ruled easier by from two-thirds seer to about one seer per rupee at Godhra (Panch Mahals), Dhulia (West Khandesh), Jalgaon (East Khandesh), Ahmednagar, Dharwar and Karwar (Kanara). At the other head-quarter stations, the price of the article remained almost stationary.

In Sind, the price of the article ruled easier by two and one-third seers at Nawabshah and dearer by about a seer at Jacobabad (Upper Sind Frontier) while at the other places it showed only small variations.

Bajri.—*Bajri* ruled easier by two and a half seers per rupee at Kaira and by from one-half seer to one and one-third seer per rupee at Ahmedabad, Godhra (Panch Mahals), Dhulia (West Khandesh), Nasik, Thana and Karwar (Kanara) while it was dearer by a little over one seer per rupee at Broach and Sholapur. At the other places the variations were small ranging between one-fourth and one-half seer per rupee.

In Sind, the price of the article ruled easier by from one to two seers per rupee at Jacobabad (Upper Sind Frontier), Mirpurkhas (Thar Parkar) and Nawabshah while at the other stations it was dearer by from one-third to one-half seer per rupee.

Rice.—Rice ruled easier by from one-third to two-thirds seer per rupee at Godhra (Panch Mahals), Broach, Nasik, Poona and Kolaba while it was dearer by from one-fourth to two-thirds seer per rupee at Kaira, Dhulia (West Khandesh), Satara, Bijapur, Dharwar and Ratnagiri. At the other places, the price was either stationary or showed only small variations.

In Sind, the article was dearer by from one-half to about two seers per rupee at all the stations in the Province.

Wheat.—Wheat was cheaper by from one-third seer to two-thirds seers per rupee at Ahmedabad, Kaira, Broach and Satara while it was dearer by from one-third of a seer to one and two-thirds seers per rupee at Jalgaon (East Khandesh), Nasik, Ahmednagar, Poona and Dharwar. At the other places, the price of the article differed but little from that in the preceding year.

In Sind, except at Hyderabad where the price of the article was dearer, by one-third seer per rupee, wheat ruled easier by from one-half seer to one and a half seers per rupee.

Gram.—Gram was cheaper by three and a half seers per rupee at Kaira, by one and a half seer per rupee at Ahmedabad and Thana and by one-half seer per rupee at Surat and Ratnagiri. On the other hand, it was dearer by from one-half seer to two seers per rupee at Godhra (Panch Mahals), Jalgaon (East Khandesh), Nasik, Poona, Sholapur, Ahmednagar and Dharwar. At the other places the price of the article was generally about the same as last year.

In Sind, the price of the article was higher by from two-thirds seer to two and two-thirds seers per rupee at all the stations except Jacobabad (Upper Sind Frontier) where it was higher by only one-fourth seer per rupee.

Turdal.—*Turdal* ruled higher by two and a half seers per rupee at Jalgaon (East Khandesh) and by from one-half seer to one and one-third seers per rupee at Godhra (Panch Mahals), Broach, Surat, Dhulia (West Khandesh), Nasik, Ahmednagar, Poona, Ratnagiri and three Karnatak stations (Belgaum, Bijapur and Dharwar). At the other places, the price was either stationary or showed only small variations.

In Sind, where *mugdal* is used in place of *turdal*, the price of the article (*mugdal*) was cheaper by half a seer at Nawabshah. At the other places in the Province the pulse ruled dearer by from one-third seer to one seer per rupee.

Gul or Raw Sugar.—The price of the article fell throughout the Bombay Presidency, during the year under report, by from one-half seer to one seer per rupee.

In Sind, similarly with the solitary exception of Hyderabad where the price of the article was slightly higher (by one-fourth seer per rupee) *gul* ruled easier at all the stations in the Province by from one-half seer to one and two-thirds seers per rupee.

In fact, the fall in the price of the article during the last two or three years is one of the most striking features of the agricultural conditions of the Bombay Presidency and has very marked economic significance in the sugarcane tracts of the Presidency.

Tobacco.—Tobacco ruled easier by one-half seer per rupee at Ahmednagar and dearer by one-third seer per rupee at Thana and two-thirds

seer per rupee at Kaira. At all the other places in the Bombay Presidency proper, the price of the article was either stationary or showed very slight variations.

In Sind, with the solitary exception of Jacobabad (Upper Sind Frontier) where it ruled easier by four-fifths seer per rupee the price of tobacco was just the same at all the stations in the Province.

Cotton.—Owing to the fall in the price of the article during the recent years, the late commencement of the monsoon over most of the Bombay Presidency, the late rise of the river in Sind, the excess of rains in most parts of Gujarat and Khandesh in August-September and the deficiency or absence of the *rabi* rains in the south-east of the Bombay Presidency which is an important cotton tract, the area under the crop in the Bombay Presidency including Sind, Western India Agency and other Indian States stood at 6,914 thousand acres, thus showing a decline of 1,203 thousand acres or 14·8 per cent. below the last year in point of area and a decrease of 277 thousand bales or 17·7 per cent. in point of out-turn below the previous year (the out-turn, during the year under report, coming to 1,289 thousand bales against 1,566 thousand bales during the preceding year). Of this total out-turn of 1,289 thousand bales, 338 thousand bales or 26·2 per cent represented the yield of the long-stapled Broach, Dharwar and Kumpta varieties, while the remaining 951 thousand bales or 73·8 per cent. belonged to short-stapled varieties of Khandesh, Gujarat and Sind. As compared with the previous year, the out-turn of the long-stapled cotton fell by 28·9 per cent. and that of the short-stapled cotton by 12·7 per cent.

The following table compares the prices of cotton during the year under report, with those of the previous year, and the average of the preceding five years :—

Variety	Price per bale of 400 lbs.			Variation.	
	Average of five years ending 1925	Average of the seven months ending 31st July		Compared with the average.	Compared with the price in 1926
		1926	1927		
	Rs.	Rs.	Rs.	Per cent	Per cent.
Broach	253	183	167	-33·9	-8·7
Khandesh	207	153	181	-12·6	+18·3
Dharwar	252	175	142	-43·7	-18·9

It will be seen from the above table that the price of the Khandesh variety increased over the previous year though it was still much below the average. The prices of the other two varieties, namely, Broach and Dharwar, fell considerably both as compared with the last year and with the average.

Fodder.—Generally speaking it may be stated that there was no actual scarcity of fodder, during the year under report. This was because while the rains from October onwards were generally deficient or absent and prevented proper grain formation, the abundant *khariif* rains and the excellent September rains, in most parts of the Bombay Presidency enabled the sowings of the principal crops supplying fodder such as *jowar*, *bajri*, rice, wheat, etc., to be done on the usual scale and these gave the requisite supply of fodder to the cattle of the Presidency. For the same reason, the supply of dry grass was also not below the mark. In consequence, the prices of both *jowari kadbi* and dry grass did not show any appreciable rise in many parts of the Presidency. The actual variations in the prices of the two are noted below.

Jowari Kadbi.—This was somewhat dearer at Surat, Sholapur and Satara. At the other places, the price of the article ruled generally easier than in the preceding year.

Dry Grass.—This was again somewhat dearer at Satara and also at Belgaum but in the other parts of the Bombay Presidency, it was generally cheaper than the last year.

In Sind, *jowari kadbi* was somewhat dearer at Sukkur and Larkana but at the other places in the Province, the price of the article ruled generally easier than last year. Dry grass was also cheaper than the previous year everywhere in the Division.

CHAPTER VII—AGRICULTURAL STOCK

37. Information under this head is collected only once in five years. The result of the last enumeration has been published in the Season and Crop Report for the year 1924-25.

CHAPTERS VIII AND IX—CONDITION OF THE AGRICULTURAL POPULATION

38. The agricultural season of 1926-27 was, on the whole, so far as the actual produce of the land is concerned, decidedly better than its predecessor. No doubt, there were adverse factors such as the excess of *khariif* rains in Gujarat and Khandesh, the deficiency of the late rains over most of the Presidency, the frequent visits of locusts in North Gujarat and Sind, the late inundation in Sind, etc., etc., which caused considerable anxiety at times but with all these drawbacks, the *khariif* crops came out successfully over most of the Presidency while the *rabi* crops also were fairly satisfactory in most of Gujarat and Khandesh. In fact, except in the south-east of the Presidency, where the *rabi* crops were definitely unsatisfactory, the season under review may be said to be fairly good over a large part of the Bombay Presidency including Sind. The net result was that there was a general sufficiency of food and fodder in most parts. The condition of cattle also was generally satisfactory. For, although rinderpest and the common foot and mouth disease appeared, as usual, in many districts nowhere did they assume such a serious aspect as to interfere with agricultural operations. The Cholera

epidemic was, however, rather serious over a large part of the Karnatak but prompt medical measures brought it under control and except a scarcity of labour which it caused in parts of this Division, it did not affect materially the agriculture of the Presidency.

39. Prices for agricultural products were either stationary or, if anything, showed a downward tendency and this fall was especially marked in the case of cotton and *gul*. On the other hand, the wages were either the same as last year or showed a rise in parts (such as the Karnatak, owing to the cholera epidemic), while scarcity of labour continued to be felt in the vicinity of large towns like Bombay. The result of these factors has been that while for the classes labouring for cash wages it has been a good year, for almost all other portions of the agricultural population it has been not very satisfactory and in some cases the difference has been very marked indeed.

40. The self-dependent small farmer, with an economic holding, chiefly employed in producing food for himself and his family, has not suffered much though the downward tendency of the prices must have caused some difficulty in paying the high labour charges and the Government assessment. But the larger man, chiefly cultivating by employed labour, has been very badly affected almost everywhere including the cotton tracts. Thus, for example, the year 1926-27 has been a very unsatisfactory year in the Deccan Canal tracts, which depend chiefly on sugarcane, and in the Cotton areas, as compared with those to which the people have been accustomed in the past. Similarly, the year has been definitely unsatisfactory in the south-east of the Bombay Presidency, comprising the East Deccan and most of the Karnatak (except the *Mallad*) where owing to the failure of *rabi* crops, the people must have found it extremely difficult to make both ends meet.

41. The general result seems to be a rise in the prosperity of the labouring classes in the rural areas, an almost stationary position in the case of the small farmer who cultivates his own land and produces crops essentially for maintenance, and a definite set-back in the case of the larger man cultivating chiefly by employed labour. These facts may lead to very marked economic changes in the future the exact nature of which it is difficult at present to forecast.
